Foreword

Uganda National Bureau of Standards (UNBS) is a parastatal under the Ministry of Trade, Industry and Cooperatives established under Cap 327, of the Laws of Uganda, as amended. UNBS is mandated to coordinate the elaboration of standards and is

(a) a member of International Organisation for Standardisation (ISO) and

(b) a contact point for the WHO/FAO Codex Alimentarius Commission on Food Standards, and

(c) the National Enquiry Point on TBT Agreement of the World Trade Organisation (WTO).

The work of preparing Uganda Standards is carried out through Technical Committees. A Technical Committee is established to deliberate on standards in a given field or area and consists of key stakeholders including government, academia, consumer groups, private sector and other interested parties.

Draft Uganda Standards adopted by the Technical Committee are widely circulated to stakeholders and the general public for comments. The committee reviews the comments before recommending the draft standards for approval and declaration as Uganda Standards by the National Standards Council.

The committee responsible for this document is Technical Committee UNBS/TC 19, [Packaging and Packaging products].
Plastic cling wrap film for food contact use — General requirements

1 Scope

This Standard specifies the definitions and terms, product classifications, marking, requirements, test methods, inspection rules, labels, packaging, transport and storage of plastic cling wrap film for food contact use.

This Standard applies to plastic cling wrap film for keeping food fresh (hereinafter referred to as cling wrap film) which is made of resin such as polyethylene, polyvinylchloride, polyvinyl dichloride, processed by the method of monolayer or multilayer extrusion.

2 Normative references

The following referenced documents referred to in the text in such a way that some or all of their content constitutes requirements of this document. For dated references, only the edition cited applies. For undated references, the latest edition of the referenced document (including any amendments) applies

DUS 1659
ISO 2859 – 5:2005 Sampling procedures for inspection by attributes – Part 5: System of sequential sampling plans indexed by acceptance quality limit (AQL) for lot-to-lot inspection
ISO 291:2008 Plastics – Standard atmosphere for conditioning and testing
ISO 4593:1993 Plastics – Film and sheeting – Determination of thickness by mechanical scanning

3 Terms and definitions

For the purposes of this standard, the following terms and definitions apply.

3.1 cling wrap film
film used to pack food. Has the function of self – cling and keeping food fresh or hygienic
3.2 self-cling
property of the cling wrap film itself, also called shear and peel strength

3.3 polyethylene cling wrap film
a type of food-use cling wrap film which is made of polyethylene (PE).

3.4 Polyvinylchloride cling wrap film
a type of food-use cling wrap film which is made of polyvinylchloride (PVC).

3.5 Polyvinyl dichloride cling wrap film
a type of food-use cling wrap film which is made of polyvinyl dichloride (PVDC).

3.6 multilayer extrusion cling wrap film
type of food-use cling wrap film which is processed by the method of multilayer extrusion.

3.7 open-wrapping
the degrees of difficulty of removing the film from the paper core during use.

3.8 anti-fogging
property of preventing a cling wrap film from forming any water drops or water fogging on the film surface

3.9 Resin

ISO and IEC maintain terminological databases for use in standardization at the following addresses:
— ISO Online browsing platform: available at http://www.iso.org/obp

4 Classification
On the basis of the materials and the process techniques, cling wrap film can be divided into polyethylene cling wrap film, polyvinylchloride cling wrap film, polyvinyl dichloride cling wrap film, and multilayer extrusion cling wrap film.

5 Requirements
5.1 Materials

5.1.1 Plastic
The plastic selected shall be a food grade material.

5.1.2 Additive
The additives selected and their dosages shall meet the provisions set out in DUS 1659.
5.2 Colour
Cling wrap film shall be a transparent, normal natural colour.

5.3 Dimensional deviation

5.3.1 Thickness deviation

<table>

</tbody>
</table>

The sample should be able to be completely peeled off within 5 seconds

Under test conditions, no water drops should adhere to the film surface, or only small localised water drops. No water drops should adhere to large areas of the cling wrap film surface.

5.6 Hygienic property

The hygienic properties for polyvinyl dichloride, polyvinylchloride and polyethylene cling film should meet the provisions on hygienic properties set out in US 1659.

The hygienic properties for multilayer extrusion cling film should meet the provisions set out in hygienic standards for corresponding items of the material in direct contact with food When testing, use the plastic film layer which comes into contact with food to carry out hygienic property tests

Cling wrap film made of other materials should meet the hygienic property provisions for specific materials set out in the corresponding standards.
6 Test methods

6.1 Sample conditioning and testing environment

The conditioning of any sample shall be conducted with the standard environment temperature of 23°C ± 2°C specified in ISO 291, and the test shall be conducted under these conditions. The conditioning time shall be longer than 4 h.

6.2 Dimensional deviation

6.2.1 Thickness

The measurements of the thickness shall be conducted in accordance with the provisions set out in ISO 4593 in order to determine uniform measurements for 10 spots along the width direction of the plastic cling wrap film. The thickness limit deviation shall be determined by formula (1).

\[ \Delta_t = t_{\text{min or max}} - t_0 \]  

1)

in which,

- \( t_{\text{min or max}} \) – the actual measured maximum or minimum value in millimetres (mm)
- \( t_0 \) – the nominal thickness, in millimetres (mm)
- \( \Delta_t \) - the thickness limit deviation, in millimetres (mm)

6.2.2 Determination of the width

The measurements of the width shall be conducted in accordance with the provisions set out in ISO 4592 in order to determine 10 isometric width measurements. The width limit deviation shall be determined by formula (2).

\[ \Delta_w = W_{\text{min or max}} - W_0 \]  

2)

in which,

- \( W_{\text{min or max}} \) – the actual measured maximum or minimum width, in millimetres (mm)
- \( W_0 \) – the nominal width, in millimetres (mm)
- \( \Delta_w \) - the width limit deviation, in millimetres (mm)

6.2.3 Roll weight (mass) deviation

Remove the outer packaging of the cling wrap film and place the cling wrap film onto a pair of scales to weigh it. The roll net weight (mass) deviation shall be determined by formula (3):

\[ \Delta_G = \left( \frac{G - G_0}{G_0} \right) \times 100 \]  

3)

in which,

- \( G \) – the actual determined net weight of the roll, in grams (g)
- \( G_0 \) – the nominal net weight of the roll, in grams (g)
\( \Delta \) – the roll net weight (mass) deviation, percentage (%)

### 6.3 Appearance test

The appearance indexes for air bubbles, perforations, ruptures and unevenness shall be determined by performing a visual inspection under natural light.

The sizes of the impurities, fish eyes and lump blocks shall be determined with a tenfold magnifier, using the maximum length to calculate. The dispersion shall be determined with a frame-board of 10 cm x 10 cm.

### 6.4 Physical and mechanical properties

#### 6.4.1 Tensile strength and nominal tensile strain at break

The determination shall be conducted in accordance with ISO 527-3. Two samples with a width of 10 mm and a gauge length of 50 mm shall be used. The test speed (no-load) is 500 mm/min ± 50 mm/min

#### 6.4.2 Right angle tear strength

The determination of right angle tear strength shall be conducted in accordance with the provisions set out in ISO 6383-1.

### 6.5 Deviation of gas transmission rate

The determination of gas transmission rate shall be conducted in accordance with the provisions set out in ISO 15105-1:2007. The deviation of the gas transmission rate shall be determined by formula (4):

\[
\Delta Y = \frac{Y - Y_0}{Y_0} \times 100 \tag{4}
\]

in which,

- \( Y \) – the actual measured oxygen transmission rate, in cubic centimetres/(m\(^2\)·24h·atm) (cm\(^3\)/(m\(^2\)·24 h atm))
- \( Y_0 \) – the nominal oxygen transmission rate, in cubic centimetres/(m\(^2\)·24h·atm) (cm\(^3\)/(m\(^2\)·24 h atm))
- \( \Delta Y \) – the deviation of the oxygen transmission rate, percentage (%)

The deviation of the carbon dioxide transmission rate shall be determined by formula (5):

\[
\Delta R = \frac{R - R_0}{R_0} \times 100 \tag{5}
\]

in which,

- \( R \) – The actual measured carbon dioxide transmission rate, in cubic centimetres/(m\(^2\)·24 hours atmospheric pressure) (cm\(^3\)/(m\(^2\)·24h·atm))
- \( R_0 \) – The nominal carbon dioxide transmission rate, in cubic centimetres/(m\(^2\)·24 hours atmospheric pressure) (cm\(^3\)/(m\(^2\)·24h·atm))
- \( \Delta R \) – The deviation of the carbon dioxide transmission rate, percentage (%)
6.6 Deviation of water vapour permeance

The determination of the water vapour permeance shall be conducted in accordance with the provisions set out in ISO 2528:1995, the deviation of the water vapour permeance shall be determined by formula (6):

\[
\Delta_H = \frac{H - H_0}{H_0} \times 100 \quad \text{(6)}
\]

in which,

H – The actual measured water vapour permeance, in grams/ (m²·24 hours) (g/(m²·24h))

H₀ – The nominal water vapour permeance in grams/ (m²·24 hours) (g/(m²·24h))

Δₜ – The deviation of the water vapour permeance, percentage (%)

6.7 Light transmissivity and haze

The determination of light transmissivity and haze shall be conducted in accordance with the provisions set out in ISO 14782.

6.8 Self-cling (shear and peel strength)

6.8.1 Sample preparation

Cut 10 sheets of sample 50 mm long and 25 mm wide, with every two sheets forming a set. Place the adhesive sides of each set of samples face to face in a lap joint, the length of the lap joint being 15 mm and the width of the lap joint being 25 mm. Lay the samples on a smooth surface, use a rubber roller (diameter of 40 mm, length of 100 mm, mass of 300 g) and carry out reciprocation rolling and press on the lap joint three times, until there is no air left between the lap-jointed layers of cling wrap film. Leave the prepared samples in an environment under test conditions for 20 minutes and then conduct the test.

6.8.2 Test method

Stretch out each set of the samples on a tension machine and determine the force needed to separate the two sheets of sample. The arithmetic mean value of the five sets shall be regarded as the result. The test instrument shall meet the provisions set out in ISO 527-3:1995 and the stretching velocity is 250 ± 50 mm/min. The self-cling (shear and peel strength) shall be determined by formula (7):

\[
T = \frac{P}{a \times b} \quad \text{(7)}
\]

in which,

T – The self-cling (shear and peel strength), in Newton/square centimetres (N/cm²)

P – The force needed to separate the sample, in Newtons (N)

b – The width of the lap joint, in centimetres (cm)

a – The length of the lap joint, in centimetres (cm)
6.9 Determination of the open - wrapping

6.9.1 Sample preparation

Cut 6 sheets of sample 150 mm long and 50 mm wide, with every two sheets forming a set. Place the adhesive sides of each set of samples face to face in a lap joint, the length of the lap joint being 100 mm. The processing and treatment methods are the same as specified in Section 6.9.1 [sic] of this Standard.

6.9.2 Test method

Fix one end of the sample and at the other end of the sample fix a 4 g weight using the self-cling of the cling wrap film or a piece of adhesive paper. Let the weight down slowly and allow the sample to peel naturally. See Diagram 1 for the test schematic. All three sample sets should meet the property requirements.

![Test schematic](image)

Figure 1 — Test schematic

7.10 Determination of the anti - fogging

Add 200 ml of water at a temperature of 23 °C ± 2 °C into each of three beakers with a volume of 1000 ml. Use three equal-sized pieces of cling wrap film, with the adhesive side facing down, to completely cover each of the beaker mouths. Ensure the film surfaces are flat, and put the three beakers into a low temperature tank at 3°C to maintain a constant temperature. After 10 minutes, check the adhesive state of the water drops on the surface of the cling wrap film. All three samples should meet the property requirements.

7 Inspection rules

7.1 Group lot

The acceptance check for the products shall use the lot as the unit. Products which are made of the same grade material have the same specifications, the same formula and have been continuously produced. One lot shall not exceed 10,000 rolls.
7.2 Inspection classification

7.2.1 Factory inspection

The factory inspection items are appearance, dimensional specification, tensile strength, nominal tensile strain at break and self-cling.

7.2.2 Type inspection

The type inspection items are all the items specified in the technical requirements. Type inspections must be conducted at least once a year.

7.3 Sampling plan

7.3.1 Dimensional deviation, appearance

Adopt the normal double sampling plan specified in ISO 2859-5. The Inspection Level (IL) shall be the general inspection level II, the Acceptance Quality Limit (AQL) shall be 7.5, see Table 6 for detailed samples and decision arrays. Each roll is regarded as one sample unit.

8.3.2 Physical and mechanical properties

Take any roll from the extracted samples to carry out the inspection.

8.3.3 Hygienic properties

Take any roll from the extracted samples to carry out the inspection.

8.4 Determination rules

8.4.1 Determination for conforming items

The determination of the appearance and dimensional deviation for the sample unit shall be conducted in accordance with Section 5.3, 5.4 respectively. If the inspection results of the sample unit meet the specifications prescribed in Table 1, then the appearance and the dimensional deviation shall be determined as conforming items.

The determination of the appearance and dimensional deviation for the sample unit shall be conducted in accordance with Section 5.3, 5.4 respectively. If the inspection results of the sample unit meet the specifications prescribed in Table 1, then the appearance and the dimensional deviation shall be determined as conforming items.

When there is any nonconforming item existing in the hygienic properties, then the hygienic properties shall be determined as nonconforming.
7.4.2 Determination for conforming lots

When all of the inspection results for appearance, dimensional deviation, physical and mechanical properties and hygienic properties conform, then the lot can be regarded as a conforming lot.

8 Packaging labels, packaging, transport and storage

Marking

Cling wrap film shall be permanently marked with the following product material markings:

a) indication of the source of manufacture and trade-mark, if any;

b) recycling symbol;

c) packing slip in each package shall be marked with the following:
   1) nominal capacity and
   2) batch number or code number

d) the containers may also be marked with the standard mark.

For the mass content of any additive which exceeds 1%, the specific name or the chemical structural of the additive must be indicated.

The nominal values of the oxygen transmission rate (unit is cm³/ (m²·24h·atm)), the carbon dioxide transmission rate (unit is cm³/ (m²·24h·atm)) and the water vapour permeance (unit is g/(m²·24h)) of a cling wrap film should be indicated.

The nominal value of the roll net weight of a cling wrap film should be indicated.

Cling wrap film should be marked with the words “for food use”.

Polyvinylchloride cling wrap film should be marked with warnings such as “Must not come into contact with food containing fats”, “Not suitable for microwave heating”, or “Must not be used at high temperatures”

For cling wrap film that can be microwave-heated, the cling wrap film should be marked with the words “Microwave oven safe”, the heating methods and the maximum safe temperature.

Marking methods can be printing, etc. The mark can be made on the outer packaging of the product or on the product itself.

8.1 Packaging labels

The packaging box (bag) shall be marked with the following information:

a) product name;

b) product quantity and dimensions;

c) name and physical address of the manufacturer;
d) production date and expiry date;

e) product material type;

f) the specific name and chemical structure of each additive;

g) the nominal values of the oxygen transmission rate, carbon dioxide transmission rate and water vapour transmission rate;

h) the nominal value of the roll net weight;

i) the words “for food use”;

j) warnings or other explanations;

8.2 Packaging

8.2.1 Inner packaging

Use film bags or racked boxes as sealed packaging.

8.2.2 Other packaging

Cardboard boxes or other suitable packaging shall be selected for the outer packaging of the products.

8.3 Transport

During the transportation of the product, attention must be paid to damp-proofing and protection from sunlight. During handling, the product must be carefully lifted up and put down and have no heavy loads placed on top of it.

8.4 Storage

The product must be stored in clean, dry warehouses, must not come into contact with any corrosive chemical substances and other harmful substances, the distance from any heat source shall be at least one metre and the reasonable storage duration shall be determined on the basis of the properties of the plastic cling wrap film. The storage duration must not exceed two years from the production date.
Bibliography

Certification marking

Products that conform to Uganda standards may be marked with Uganda National Bureau of Standards (UNBS) Certification Mark shown in the figure below.

The use of the UNBS Certification Mark is governed by the Standards Act, and the Regulations made thereunder. This mark can be used only by those licensed under the certification mark scheme operated by the Uganda National Bureau of Standards and in conjunction with the relevant Uganda Standard. The presence of this mark on a product or in relation to a product is an assurance that the goods comply with the requirements of that standard under a system of supervision, control and testing in accordance with the certification mark scheme of the Uganda National Bureau of Standards. UNBS marked products are continually checked by UNBS for conformity to that standard.

Further particulars of the terms and conditions of licensing may be obtained from the Director, Uganda National Bureau of Standards.
