Buses - Requirements of Construction

1- Scope and field of application

This standard specifies the general requirements for large and small buses (M₂ and M₃ buses) include single-deck, double-deck, rigid or articulated.

This standard applies to buses with a capacity more/less than 22 passengers.

This standard do not apply to the vehicles designed for the carriage of school children (school buses), the secure transport of persons (prisoners) and the carriage of injured or sick persons (ambulances).

2-Definitions

For the purposes of this standard, the following terms and definitions apply.

2.1 Articulated vehicle

A vehicle which consists of two or more rigid sections which articulate relative to one another; the passenger compartments of each section intercommunicate so that passengers can move freely between them; the rigid sections are permanently connected so that they can only be separated by an operation involving facilities which are normally only found in a workshop.

2.1.1 Double-decker articulated vehicle

A vehicle which consists of two or more rigid sections which articulate relative to one another; the passenger compartments of each section intercommunicate on at least one deck so that passengers can move freely between them; the rigid sections are permanently connected so that they can only be separated by an operation involving facilities which are normally only found in a workshop.

2.1.4 Low floor vehicle

Is a vehicle of Class I, II or A in which at least 35 per cent of the area available for standing passengers (or in its forward section in the case of articulated vehicles, or in its lower deck in the case of double-decker vehicles) forms an area without steps and includes access to at least one service door.

2.1.5 Bodywork

A separate technical unit comprising all the special internal and external equipment of the vehicle.

2.1.6 Double-deck vehicle

A vehicle where the provided spaces for passengers are arranged, at least in one part, in two superimposed levels and spaces for standing passengers are not provided in the upper deck.

2.1.7 Separate technical unit

A device intended to be part of a vehicle, which may be type-approved separately but only in relation to one or more specified types of vehicle.

2.1.8 Trolleybus

A vehicle, electrically driven by energy from external, overhead contact wires. For the purposes of this standard, it also includes such vehicles having an additional internal means of propulsion (dual mode vehicles) or having a means of temporary external guidance (guided trolleybuses).

2.1.9 Vehicle without roof¹

¹ The use of these vehicles may be subject to rules established by National Administrations.

A vehicle without roof over all or part of its deck. In the case of a double-decked vehicle this shall be the upper deck. Space for standing passengers shall not be provided on any deck without roof, independently of the class of vehicle.

2.2 Definition of type(s)

2.2.1 Vehicle type

Vehicles, which do not differ in the following essential aspects:

- (a) Bodywork manufacturer;
- (b) Chassis manufacturer;
- (c) Vehicle concept (> 22 passengers or ≤ 22 passengers);
- (d) Bodywork concept (single / double-deck, articulated, low-floor);
- (e) Bodywork type if the bodywork has been approved as a separate technical unit.

2.2.2 Bodywork type

For the purposes of type-approval as a separate technical unit means a category of bodywork which does not essentially differ in the following aspects:

- (a) Bodywork manufacturer;
- (b) Vehicle concept (> 22 passengers or ≤ 22 passengers);
- (c) Bodywork concept (single/ double-deck, articulated, low-floor);
- (d) Mass of the completely equipped vehicle bodywork, differing by 10 per cent;
- (e) Specified types of vehicle on which the type of the bodywork can be installed.

2.2.3 Fire suppression system type

For the purpose of type approval as a component means a category of systems which does not essentially differ in the following aspects:

- (a) Fire suppression system manufacturer;
- (b) Extinguishing agent;
- (c) Type of discharge point(s) used (e.g. type of nozzle, extinguishing agent generator or extinguishing agent discharge tube);
- (d) Type of propellant gas, if applicable."

2.3 "Approval of a vehicle, a separate technical unit or a component" means the approval of a type of vehicle, bodywork or component as defined in paragraph 2.2 with regard to the constructional features specified in this standard.

2.4 Superstructure

The part of the bodywork which contributes to the strength of the vehicle in the event of a roll-over accident.

2.5 Service door

A door intended for use by passengers in normal circumstances with the driver seated.

2.6 Double door

A door affording two, or the equivalent of two, access passages.

2.7 Sliding door

A door which can be opened or closed only by sliding it along one or more rectilinear or approximately rectilinear rails.

2.8 Emergency door

A door intended for use by passengers as an exit only exceptionally and in particular in an emergency.

2.9 Emergency window

A window, not necessarily glazed, intended for use as an exit by passengers in an emergency only.

2.10 Double or multiple window

An emergency window which, when divided into two or more parts by imaginary vertical line(s) (or plane(s)), exhibits two or more parts respectively, each of which complies as to dimensions and access with the requirements applicable to a normal emergency window.

2.11 Escape hatch

An opening in the roof or the floor intended for use as an emergency exit by passengers in an emergency only.

2.12 Emergency exit

An emergency door, emergency window or escape hatch.

2.13 Exit

A service door, intercommunication staircase, half-staircase or emergency exit.

2.14 Floor or deck**2.14.1 Floor**

That part of the bodywork whose upper surface supports standing passengers, the feet of seated passengers and the driver and any crew member, and may support the seat mountings;

2.14.2 Deck

That part of the floor provided only for the passengers.

2.15 Gangway

Means the space providing access by passengers from any seat or row of seats or each special area for wheelchair users to any other seat or row of seats or each special area for wheelchair users or to any access passage from or to any service door or intercommunication staircase and any area for standing passengers; it does not include:

2.15.1 The space extending 300 mm in front of any seat, except where a sideways-facing seat is situated above a wheel arch, in which case this dimension may be reduced to 225 mm (see Annex 2, Figure 24);

2.15.2 The space above the surface of any step or staircase (except where the surface of the step is contiguous with that of a gangway or access passageway); or

2.15.3 Any space which affords access solely to one seat or row of seats or a facing pair of transverse seats or row of seats.

2.16 Access passage

The space extending inwards into the vehicle from the service door up to the outermost edge of the upper step (edge of the gangway), intercommunication staircase or half-staircase. Where there is no step at the door, the space to be considered as access passage shall be that which is measured according to Annex 1, paragraph A.1.7.1 up to a distance of 300 mm from the starting position of the inner face of the test gauge.

2.17 Driver's compartment

The space intended for driver's exclusive use except in the case of an emergency and containing the driver's seat, the steering wheel, controls, instruments and other devices necessary for driving or operating the vehicle.

2.18 Mass of the vehicle in running order

The mass of the unladen vehicle with bodywork, and with coupling device in the case of a towing vehicle, in running order, or the mass of the chassis with cab if the manufacturer does not fit the bodywork and/or coupling device (including coolant, oils, 90 per cent fuel, 100 per cent other liquids except used waters, tools, spare wheel and driver (75 kg), and, for buses and coaches, the mass of the crew member (75 kg) if there is a crew seat in the vehicle.

2.19 Technically permissible maximum laden mass (M)

The maximum mass of the vehicle based on its construction and performance, stated by the manufacturer. The technically permissible maximum laden mass is used to determine the vehicle category.

2.20 Passenger

A person, other than the driver or a member of the crew.

2.21 Passenger with reduced mobility

All passengers who have a difficulty when using public transport, such as disabled people (including people with sensory and intellectual impairments, and wheelchair users, people with limb impairments, people of small stature, people with heavy luggage, elderly people, pregnant women, people with shopping trolleys, and people with children (including children seated in pushchairs).

2.22 Wheelchair user

A person who due to infirmity or disability uses a wheelchair for mobility.

2.23 Member of the crew

A person assigned to operate as a co-driver or the possible assistant.

2.24 Passenger compartment

A space intended for passengers' use excluding any space occupied by fixed appliances such as bars, kitchenettes, toilets or baggage/goods compartments.

2.25 Power-operated service door

A service door which is operated exclusively by energy other than muscular energy and the opening and closing of which, if not automatically operated, is remotely controlled by the driver or a member of the crew.

2.26 Automatically-operated service-door

A power-operated service door which can be opened (other than by means of emergency controls) only after a control is operated by a passenger and after activation of the controls by the driver, and which closes again automatically.

2.27 Starting prevention device

A device which prevents the vehicle being driven away from rest when a door is not fully closed.

2.28 Driver operated service door

A service door which normally is opened and closed by the driver.

2.29 Priority seat

A seat with additional space for a passenger with reduced mobility and marked accordingly.

2.30 Boarding device

A device to facilitate wheelchair access to vehicles, such as lifts, ramps, etc.

2.31 Kneeling system

A system which lowers and lifts totally or partially the body of a vehicle relative to the normal position of travel.

2.32 Lift

A device or system with a platform that can be raised and lowered to provide passenger access between the floor of a passenger compartment and the ground or kerb.

2.33 Ramp

A device to bridge the gap between the floor of a passenger compartment and the ground or kerb. In its position for use, it includes any surface that may move as part of the ramp

deployment or be available for use only when the ramp is in its deployed position and over which a wheelchair is intended to travel.

2.34 Portable ramp

A ramp that may be detached from the vehicle structure and capable of being deployed by a driver or crew member.

2.35 Demountable seat

A seat that can be easily detached from the vehicle.

2.36 "Front" and "rear"

The front or rear of the vehicle according to the normal direction of travel and the terms; "forward", "foremost", "rearward" and "rearmost" etc. shall be construed accordingly.

2.37 Intercommunication staircase

A staircase which allows communication between the upper and lower decks.

2.38 Separate compartment

A space in the vehicle which may be occupied by passengers or crew when the vehicle is in use and which is separated from any other passenger or crew space, except where any partition allows passengers to see into the next passenger space, and is connected by a gangway without doors.

2.39 Half staircase

Is a staircase from the upper deck which terminates in an emergency door.

2.40 Service-door lighting

A lighting device(s) of the vehicle designed to illuminate the exterior vicinity of service doors and wheels.

2.41 Overnight locking system

A system designed to provide the possibility to secure the service and emergency doors of the vehicle against opening. Systems that are intended to be operated by passengers from inside the vehicle shall not be regarded as overnight locking systems.

2.42 Emergency lighting system

A system that provides a minimum level of lighting necessary to enable occupants to safely egress from the vehicle, including the emergency exits.

2.43 Safety sign

A configuration of visual elements intended to convey a safety-related message.

3- Buses classifications

3.1 For buses with a capacity exceeding 22 passengers in addition to the driver, there are three classes of vehicles:

3.1.1 Class I

Buses constructed with areas for standing passengers, to allow frequent passenger movement.

3.1.1 Class II

Buses constructed principally for the carriage of seated passengers, and designed to allow the carriage of standing passengers in the gangway and/or in an area which does not exceed the space provided for two double seats.

3.1.1 Class III

Buses constructed exclusively for the carriage of seated passengers;

Note: A vehicle may be regarded as belonging in more than one Class. In such a case it may be approved for each Class to which it corresponds.

3.2 For buses with a capacity not exceeding 22 passengers in addition to the driver, there are two classes of vehicles:**3.2.1 Class A**

Buses designed to carry standing passengers; a vehicle of this class has seats and shall have provision for standing passengers.

3.2.2 Class B

Buses not designed to carry standing passengers; a vehicle of this class has no provision for standing passengers.

4- Requirements

4.1 All vehicles shall comply with the provisions set out in Annex 1 to this standard. The approval of a vehicle incorporating bodywork approved shall be completed in accordance with Annex 1. Fire suppression systems approved separately shall comply with Annex 8, Part 1. In the case of an approval of a vehicle with a fire suppression system installed in a specific engine compartment, it shall comply with the requirements of Annex 8, Part 2."

4.2 Vehicles of Class I shall be accessible for people with reduced mobility, including at least one wheelchair user and one pram or unfolded pushchair according to the technical provisions laid down in Annex 8. In rigid vehicles of Class I the area for the accommodation of a wheelchair may be combined with the area for the accommodation of an unfolded pushchair or pram. In such a case, the area shall have signs fixed on or adjacent to the area with the following text, equivalent text or pictogram:

"Please give up this space for a wheelchair user".

4.3 Contracting Parties shall be free to choose the most appropriate solution to achieve improved accessibility in vehicles other than those of Class I. However, if vehicles other than those of Class I are equipped with features or devices for people with reduced mobility and/or wheelchair users, those features or devices shall comply with the relevant requirements of Annex 5.

4.4 Nothing in this standard shall prevent the national authorities of a Contracting Party from specifying that certain types of operation are reserved for vehicles which are equipped for the transport of passengers with reduced mobility in accordance with Annex 5.

4.5 Unless otherwise stated, all measurements shall be made when the vehicle is at its mass in running order and it is standing on a smooth and horizontal ground surface and in the normal condition for travel. If a kneeling system is fitted, it shall be set so the vehicle is at its normal ride height for travel. In the case of approval of bodywork as a separate technical unit the position of the body relative to the flat horizontal surface shall be specified by the manufacturer.

4.6 Wherever there is a requirement in this standard for a surface in the vehicle to be horizontal or at a specific angle when the vehicle is at its mass in running order, in the case of a vehicle with mechanical suspension, the surface may exceed this slope or possess a slope when the vehicle is at its mass in running order, provided that this requirement is met when the vehicle is in the loading condition declared by the manufacturer. If a kneeling system is fitted to the vehicle, it shall not be in operation.

4.7 Air Conditioning system is required and has to be :

- System capable to pull down from 55°C to 26°C within 30 minutes .
- Be able to achieve constant passenger and driver compartment temperatures of 26°C under frequent door opening .

Annex 1**Requirements to be met by all vehicles****A.1 Requirements****A.1.1 General**

A.1.1.1 If the driver's compartment is without a roof, the driver should have some special protection against strong wind, sudden dust, heavy rain, etc.

A.1.2 Masses and dimensions**A.1.2.1 The vehicles shall comply with the requirements of Annex 6.****A.1.2.2 Area available for passengers.**

A.1.2.2.1 The total surface area S_0 available for passengers is calculated by deducting from the total area of the floor of the vehicle:

A.1.2.2.1.1 The area of the driver's compartment.

A.1.2.2.1.2 The area of steps at doors and the area of any other step with a depth of less than 300 mm and the area swept by the door and its mechanism when it is operated.

A.1.2.2.1.3 The area of any part over which the vertical clearance is less than 1,350 mm measured from the floor disregarding permitted intrusion specified in paragraphs A.1.7.8.6.3 and A.1.7.8.6.4 of this annex. In the case of vehicles of Class A or B, this dimension may be reduced to 1,200 mm.

A.1.2.2.1.4 The area of any part of the vehicle to which access by passengers is prevented as defined in paragraph A.1.9.4 of this annex;

A.1.2.2.1.5 The area of any space reserved solely for the carriage of goods or baggage and from which passengers are excluded.

A.1.2.2.1.6 The area required to provide a clear working area at serveries.

A.1.2.2.1.7 The floor area occupied by any staircase, half staircase, intercommunication staircase or the surface of any step.

A.1.2.2.2 The surface area S_1 available for standing passengers (only in the case of vehicles of Class A, II, and I in which the carriage of standing passengers is allowed) is calculated by deducting from S_0 :

A.1.2.2.2.1 The area of all parts of the floor in which the slope exceeds the maximum permissible values as determined in paragraph A.1.7.6. of this annex.

A.1.2.2.2.2 The area of all parts which are not accessible to a standing passenger when all the seats are occupied, with the exception of folding seats.

A.1.2.2.2.3 The area of all parts where the clear height above the floor is less than the gangway height specified in paragraph A.1.7.5.1 of this annex (handholds shall not be taken into account in this connection).

A.1.2.2.2.4 The area forward of a transverse vertical plane passing through the centre of the seating surface of the driver's seat (in its rearmost position).

A.1.2.2.2.5 The area 300 mm in front of all seats other than folding seats, except in the case of a sideways-facing seat, in which case this dimension may be reduced to 225 mm. In the case of variable seating arrangements, of any seat when considered to be in use, see paragraph A.1.2.2.4.

A.1.2.2.2.6 Any surface not being excluded by the provisions in paragraphs A.1.2.2.2.1 to A.1.2.2.2.5, on which it is not possible to place a rectangle of 400 mm x 300 mm.

A.1.2.2.2.7 In vehicles of Class II, the area in which standing is not allowed.

A.1.2.2.2.8 In double-deck vehicles, any area of the upper deck.

A.1.2.2.2.9 The surface of the wheelchair space(s) when considered occupied by a wheelchair user(s), see paragraph A.1.2.2.4 .

A.1.2.2.2.10 The surface of any wheelchair space(s) dedicated solely for the use of wheelchair user(s).

A.1.2.2.3 There shall be on the vehicle a number (P) of seating places, other than folding seats, which conform to the requirements of paragraph A.1.7.8 . If the vehicle is of Class I, II or A the number of seating places on each deck shall be at least equal to the number of square metres of floor on that deck available for passengers and crew (if any) rounded down to the nearest whole number; this number may, in vehicles of Class I, excluding the upper deck, be reduced by 10 per cent.

A.1.2.2.4 In the case of a vehicle equipped with a variable seating capacity the area available for standing passengers (S_1) and the provisions of paragraph A.6.3.3.1 shall be determined for each of the following conditions as applicable:

A.1.2.2.4.1 With all possible seats occupied followed by the remaining area for standing passengers and, if space remains, any wheelchair spaces occupied.

A.1.2.2.4.2 With all possible standing areas occupied followed by the remaining seats available for seated passengers and, if space remains, any wheelchair spaces occupied.

A.1.2.2.4.3 With all possible wheelchair spaces occupied followed by the remaining area for standing passengers and then the remaining seats available for use occupied.

A.1.2.3 Marking of vehicles

A.1.2.3.1 Space shall be provided in the driver's area, in a position clearly visible to the driver in his seating position, for the markings provided for in paragraph A.6.3.3.

A.1.2.3.1.1 The maximum number of seating places the vehicle is designed to carry.

A.1.2.3.1.2 The maximum number of standing places, if any, the vehicle is designed to carry.

A.1.2.3.1.3 The maximum number of wheelchairs, which the vehicle is, designed to carry, if any.

A.1.3 Prevention of accidents

A.1.3.1 If the engine compartment of a vehicle is located to the rear of the driver's Compartment, it shall not be possible to start the engine from the driver's position when the main engine access panel located in the rear face of the vehicle is open and which provide direct access to parts that represent a hazard when the engine is running (e.g. pulley of belt drives)."

A.1.4 Stability test

A.1.4.1 The stability of a vehicle shall be such that the point at which overturning occurs would not be passed if the surface on which the vehicle stands were tilted to both sides in turn to an angle of 28 degrees from the horizontal.

A.1.4.2 For the purposes of the above test, the vehicle shall be at its mass in running order as described in paragraph 2.18. of this standard, with the addition of:

A.1.4.2.1 Loads equal to Q (as defined in paragraph A.6.3.2.3.2.1) shall be placed on each passenger seat (of the upper deck only in the case of double-deck vehicles).

If a single deck vehicle is intended for standees or with a crew member who is not seated, the centre of gravity of the loads Q or 75 kg representing them, shall be uniformly distributed over the standee or crew area respectively, at a height of 875 mm. If a double-deck vehicle is intended to be used with a crew member who is not seated, the centre of gravity of the mass of 75 kg representing the crew member shall be placed in the upper deck gangway at a height of 875 mm.

Where a vehicle is equipped to carry luggage on the roof, a uniformly distributed mass (BX) of not less than that declared by the manufacturer in accordance with paragraph A.6.3.2.3.2.1, representing such baggage shall be secured to the roof. The other baggage compartments shall not contain any baggage.

A.1.4.2.2 If the vehicle has a variable seating capacity, standing capacity or is designed to carry one or more wheelchairs, in respect of any area of the passenger compartment in which such variations occur, the loads in paragraph A.1.4.2.1 shall be the greater of:

- (a) The mass represented by the number of seated passengers that may occupy the area including the mass of any demountable seats; or
- (b) The mass represented by the number of standing passengers that may occupy the area; or
- (c) The mass of wheelchairs and users that may occupy the area at a total mass of 250 kg each placed at a height of 500 mm above the floor in the centre of each wheelchair space; or
- (d) The mass of seated passengers, standing passengers and wheelchairs users and any combination of these that may occupy the area.

A.1.4.3 The height of any step used to prevent a wheel of the vehicle from slipping sideways on a tilt test rig shall not be greater than two-thirds of the distance between the surface upon which the vehicle stands before it is tilted and that part of the rim of that wheel which is nearest to the surface when the vehicle is loaded in accordance with paragraph A.1.4.2.

A.1.4.4 During the test, no parts of vehicle which are not intended to come into contact in normal use shall not do so, nor shall any part become damaged or deranged.

A.1.4.5 Alternatively, a calculation method can be used to show that the vehicle will not overturn under the conditions described in paragraphs A.1.4.1 and A.1.4.2. Such a calculation shall take into account the following parameters:

A.1.4.5.1 Masses and dimensions;

A.1.4.5.2 Height of centre of gravity;

A.1.4.5.3 Spring rates;

A.1.4.5.4 Vertical and horizontal tyre rates;

A.1.4.5.5 Characteristics of the control of air pressure in the air springs;

A.1.4.5.6 Position of the centre of moments;

A.1.4.5.7 Torsion resistance of the body.

The method of calculation is described in the appendix to this annex.

A.1.5 Protection against fire risks

A.1.5.1 Engine compartment

A.1.5.1.1 No flammable sound-proofing material or material liable to become impregnated with fuel, lubricant or other combustible material shall be used in the engine compartment unless the material is covered by an impermeable sheet.

A.1.5.1.2 Precautions shall be taken, either by a suitable layout of the engine compartment or by the provision of drainage orifices, to avoid, so far as possible, the accumulation of fuel, lubricating oil or any other combustible material in any part of the engine compartment.

A.1.5.1.3 A partition of heat-resisting material shall be fitted between the engine compartment or any other source of heat (such as a device designed to absorb the energy liberated when a vehicle is descending a long gradient, e.g. a retarder, or a device for heating the interior of the body other, however, than a device functioning by warm water circulation) and the rest of the vehicle. All fixings, clips, gaskets, etc., used in conjunction with the partition shall be fire resistant.

A.1.5.1.4 A heating device operating other than by hot water may be provided in the passenger compartment if it is encased in material designed to resist the temperatures generated by the device, emits no toxic fumes and is positioned such that no passenger is likely to come into contact with any hot surface.

A.1.5.1.5 In the case of vehicles having an internal combustion engine or a combustion heater located to the rear of the driver's compartment, the compartment shall be equipped with an alarm system providing the driver with both an acoustic and a visual signal, and activating the hazard warning signal, in the event of excess temperature in the engine compartment and in each compartment where a combustion heater is located.

In addition to the alarm system, vehicles of Classes I, II and III shall be equipped with a fire suppression system in the engine compartment and each compartment where a combustion heater is located. Vehicles of Classes A and B, may be equipped with a fire suppression system in the engine compartment and in each compartment where a combustion heater is located..

A.1.5.1.5.1 The alarm system and the fire suppression system, if fitted, shall be automatically activated through a fire detection system. The detection system shall be designed so as to detect a temperature in the engine compartment, and in each compartment where a combustion heater is located in excess of the temperature occurring during normal operation.

A.1.5.1.5.2 Paragraph A.1.5.1.5.1 is considered to be satisfied if the following areas of the engine compartment, and each compartment where a combustion heater is located, are monitored regarding excess temperature:

A.1.5.1.5.2.1 Areas in which, in case of leakage, flammable fluids (liquid or gas) may come into contact with exposed components, e.g. the supercharger or the exhaust-system, including engine mounted components, whose working temperature is equal to or greater than the ignition temperature of the flammable fluids (liquid or gas);

A.1.5.1.5.2.2 Areas in which, in case of leakage, flammable fluids (liquid or gas) may come into contact with shielded components, e.g. an independent heating device, whose working temperature is equal to or greater than the ignition temperature of the flammable fluids (liquid or gas); and

A.1.5.1.5.2.3 Areas in which, in case of leakage, flammable fluids (liquid or gas) may come into contact with components, e.g. the alternator, whose temperature, in case of failure, may be equal to or greater than the ignition temperature of the flammable fluids (liquid or gas).

A.1.5.1.5.3 The alarm system and the fire suppression system shall be operational whenever the engine start device is operated, until such time as the engine stop device is operated, regardless of the vehicle's attitude. They may remain operational after the ignition is switched off or the vehicle master control switch is deactivated, wherever applicable.

A.1.5.1.5.4 The installation of the fire suppression system shall comply with the following requirements ;

A.1.5.1.5.4.1 The fire suppression system shall be installed according to the system manufacturer's installation manual.

A.1.5.1.5.4.2 An analysis shall be conducted prior to the installation in order to determine the location and direction of the suppression agent discharge point(s) (e.g. nozzles, extinguishing agent generators or extinguishing agent discharge tube or other distribution points). Potential fire hazards within the engine compartment and each compartment where a combustion heater is located, shall be identified and the discharge point(s) located such that the suppression agent will be distributed to cover the fire hazard when the system activates. The spray pattern and direction of discharge points, as well as the discharge distance, shall be ensured to cover identified fire hazards. The system shall also be ensured to work properly regardless of the vehicle's attitude.

The fire hazard analysis shall, as a minimum, take into account the following components:

- (a) Those whose surface may reach temperatures above the auto-ignition temperature for fluids, gases or substances that are present within the compartment;
 - (b) Electrical components and cables with a current or voltage high enough for an ignition to occur;
 - (c) Hoses and containers with flammable liquid or gas (in particular if those are pressurized).
- The analysis shall be fully documented.

A.1.5.1.5.4.3 The suppression system shall be scaled from the tested system, based on the total gross volume of the engine and combustion heater compartments where the system is to be installed. When measuring the engine compartment and the combustion heater compartments, the gross volume of these compartments shall be measured, i.e. the volume of the engine and its components shall not be subtracted.

The scaling of the system includes the mass of the suppression agent, all discharge points and the mass of the propellant gas container, if applicable. The system pressure shall remain the same as in the tested system. If the system includes a discharge tube for the extinguishing agent, the length of the tube shall be scaled without nozzles. It is acceptable if the suppression system has more extinguishing agent and/or more discharge points and/or a longer discharge tube for the extinguishing agent and/or more propellant gas than required according to the scaling models found below.

If the gross volume of the engine and combustion heater compartments exceed 4 m³, the suppression system shall be scaled up using the following scaling factor calculated in (1) below. If the gross volume is less than 4 m³, it is allowed to scale down the suppression system using the scaling factor (2) below. S_x denotes the scaling factor and x denotes the total gross volume including the engine and combustion heater compartments [m³].

$$S_x = 0.1 \cdot x + 0.6 \quad (1)$$

$$S_x = 0.15 \cdot x + 0.4 \quad (2)$$

The scaled number of nozzles or other discharge points, if the suppression system has more than one discharge point may be rounded to the closest whole number.

A.1.5.2 Electrical equipment and wiring

A.1.5.2.1 All cables shall be well insulated and all cables and electrical equipment shall be able to withstand the temperature and humidity conditions to which they are exposed. In the engine compartment, particular attention shall be paid to their suitability to withstand the environmental temperature and the effects of all likely contaminants.

A.1.5.2.2 No cable used in an electrical circuit shall carry a current in excess of that acceptable for such a cable in the light of its mode of installation and the maximum ambient temperature.

A.1.5.2.3 Every electrical circuit feeding an item of equipment other than the starter, the ignition circuit (positive ignition), the glow-plugs, the engine-stopping device, the charging

circuit and the battery earth connection shall include a fuse or a circuit breaker. Circuits feeding other equipments may, however, be protected by a common fuse or a common circuit-breaker, provided that their sum rated capacity does not exceed the capacity of a fuse or of a circuit-breaker. In the case of multiplexing, the manufacturer shall give all the relevant technical information at the request of the technical service responsible for conducting the tests.

A.1.5.2.4 All cables shall be well protected and shall be held securely in position in such a way that they cannot be damaged by cutting, abrasion or chafing.

A.1.5.2.5 Where the voltage exceeds 100 V RMS (Root Mean Square) in one or more electrical circuits in a vehicle, a manually-operated isolating switch which is capable of disconnecting all such circuits from the main electrical supply shall be connected in each pole of that supply which is not electrically connected to earth, and shall be located inside the vehicle in a position readily accessible to the driver, provided that no such isolating switch shall be capable of disconnecting any electrical circuit supplying the mandatory external vehicle lights. This paragraph does not apply to high tension ignition circuits nor to self-contained circuits within a unit of equipment in the vehicle.

A.1.5.2.6 All electrical cables shall be so located that no part can make contact with any fuel line or any part of the exhaust system, or be subjected to excessive heat, unless suitable special insulation and protection is provided, as for example to a solenoid-operated exhaust valve.

A.1.5.3 Batteries

A.1.5.3.1 All batteries shall be well secured and easily accessible.

A.1.5.3.2 The battery compartment shall be separated from the passenger compartment and driver's compartment and ventilated to outside air.

A.1.5.3.3 The battery terminals shall be protected against the risk of short circuit.

A.1.5.4 Fire extinguishers and first-aid equipment

A.1.5.4.1 Space shall be provided for the fitting of one or more fire extinguishers, one being near the driver's seat. In vehicles of Class A or B the space for each required extinguisher shall be not less than 8 dm³ and for in Class I, II or III not less than 15 dm³. In the case of a double-deck vehicle, an additional extinguisher space shall be provided on the upper deck.

A.1.5.4.2 Space shall be provided for the fitting of one or more first-aid kits. The space provided shall be not less than 7 dm³, the minimum dimension shall not be less than 80 mm.

A.1.5.4.3 Fire extinguishers and first aid kits may be secured against theft or vandalism (e.g. in an internal locker or behind breakable glass), provided that the locations of these items are clearly marked and means are provided for persons to extract them easily in an emergency.

A.1.5.5 Materials

No flammable material shall be permitted within 100 mm of the exhaust system component, any high voltage electrical equipment or any other significant source of heat unless the material is effectively shielded. Where necessary, shielding shall be provided to prevent grease or other flammable materials coming into contact with exhaust system or other significant heat sources. For the purposes of this paragraph, a flammable material is considered to be one which is not designed to withstand the temperatures likely to be encountered in that location.

A.1.5.6 Fire detection

A.1.5.6.1 Vehicles shall be equipped with an alarm system detecting either an excess temperature or smoke in toilet compartments, driver's sleeping compartments and other separate compartments.

A.1.5.6.2 Upon detection, the system given in paragraph A.1.5.6.1 shall provide the driver with both an acoustic and a visual signal in the driver's compartment and shall activate the hazard warning signal.

A.1.5.6.3 The alarm system shall be at least operational whenever the engine start device is operated, until such time as the engine stop device is operated, regardless of the vehicle's attitude.

A.1.6 Exits (doors)

A.1.6.1 Number of exits

A.1.6.1.1 The minimum number of doors in a vehicle shall be two, either two service doors or one service door and one emergency door. Every double-deck vehicle shall have two doors on the lower deck (see also paragraph A.1.6.2.3). The minimum number of service doors required is as follows:

Number of passengers	Minimum number of service doors		
	Classes I & A	Class II	Classes III & B
9 - 45	1	1	1
46 - 70	2	1	1
71 - 100	3 (2 in the case of a double-deck vehicle)	2	1
> 100	4	3	1

A.1.6.1.2 The minimum number of service doors in each rigid section of an articulated vehicle shall be one except that this minimum number shall be two in the case of front section of an articulated vehicle of Class I.

A.1.6.1.3 For the purpose of this requirement, service doors equipped with a power-operated control system shall not be deemed to be emergency doors unless they can be readily opened by hand, once the control prescribed in paragraph A.1.6.5.1 has been actuated, if necessary.

A.1.6.1.4 The minimum number of emergency exits shall be such that the total number of exits in a separate compartment is as follows:

Number of passengers and crew to be accommodated in each compartment or deck	Minimum total number of exits
1 - 8	2
9 - 16	3

Number of passengers and crew to be accommodated in each compartment or deck	Minimum total number of exits
17 - 30	4
31 - 45	5
46 - 60	6
61 - 75	7
76 - 90	8
91 - 110	9
111 - 130	10
>130	11

The number of exits for each separate deck (in the case of a double-deck vehicle) and each separate compartment shall be determined separately. Toilet compartments or galleys are not considered to be separate compartments for the purposes of defining the number of emergency exits. Escape hatches can only count as one of the above-mentioned number of emergency exits.

A.1.6.1.5 Each rigid section of an articulated vehicle shall be treated as a separate vehicle for the purpose of determining the minimum number and the position of exits, except for paragraph A.1.6.2.4 The connecting passage between them shall not be considered as an exit. Toilet compartments or galleys are not considered to be separate compartments for the purposes of defining the number of emergency exits. The number of passengers shall be determined for each rigid section. The plane, which contains the horizontal axis of the hinge between conjoined rigid sections of the vehicle, and perpendicular to the longitudinal axis of a vehicle, when it moves straight, shall be considered as the border between sections.

A.1.6.1.6 A double service door shall count as two doors and a double or multiple windows as two emergency windows.

A.1.6.1.7 If the driver's compartment does not provide access to a passenger compartment by means of a passageway that permits:

- (a) The front edge of the cylindrical gauge referred to in Annex 2, Figure 6 to reach at least the transverse vertical plane tangential to the foremost point of the driver's seat back in its rearmost longitudinal position, and
- (b) From this plane, to move the panel shown in Annex 2, Figure 7 forwards from the contact position, with the cylindrical gauge until it reaches at least the vertical plane tangential to the foremost point of the driver's seat cushion,

then the requirements of the following paragraphs A.1.6.1.7.1 to A.1.6.1.7.5 shall be met:

A.1.6.1.7.1 The driver's compartment shall have two exits, which shall not both be in the same lateral wall. When one of the exits is a window, this window it shall have a minimum area of 400,000 mm², it shall be possible to inscribe in this area a rectangle measuring 500 mm x 700 mm and it shall comply with the requirements set out in paragraph A.1.6.8 for emergency windows.

A.1.6.1.7.2 One or two seats are permitted alongside the driver for additional people, in which case both of the exits referred to in paragraph A.1.6.1.7.1 shall be doors.

The driver's door shall be accepted as the emergency door for the occupants of those seats, provided that it is possible to move a test gauge from the occupants' seats to the exterior of the vehicle through the driver's door (see Annex 2, Figure 25).

Verification of the access to the driver's door shall be subject to the requirements of paragraph A.1.7.3.2, by using the test gauge having a dimension of 600 x 400 mm, as described in paragraph A.1.7.3.3.

The service door shall be in the side of the vehicle opposite to that containing the driver's door and shall be accepted as the emergency door for the driver.

A.1.6.1.7.3 Paragraphs A.1.6.3 to A.1.6.7, A.1.7.1, A.1.7.2 and A.1.7.7 of this annex shall not apply to the exits provided for the driver's compartment as referred to in paragraphs A.1.6.1.7.1 and A.1.6.1.7.2.

A.1.6.1.7.4 In the circumstances described in paragraphs A.1.6.1.7.1 and A.1.6.1.7.2, the exits provided in the driver's compartment, and for the occupants of any seats alongside the driver shall not count as one of the doors required by paragraphs A.1.6.1.1 to A.1.6.1.2 nor as one of the emergency exits required by paragraph A.1.6.1.4 of this annex for any other passenger compartment.

A.1.6.1.7.5 Up to five additional seats may be fitted in a compartment incorporating the driver's compartment and any seats alongside the driver, provided that the additional seats and the space for these seats comply with all requirements of this standard and at least one of the emergency exits required by paragraph A.1.6.1.4 is a door giving access to the passenger compartment complying with the requirements of paragraph A.1.6.3.1.2 of this annex for emergency doors.

A.1.6.1.8 If the driver's compartment is accessible from a passenger compartment by means of a passageway complying with the requirements of subparagraphs (a) and (b) of paragraph A.1.6.1.7. above, and any seats adjacent to this driver's compartment, are accessible from that same passenger compartment by means of a passageway complying with one of the conditions described in paragraph A.1.7.5.1.1 of this annex, no external exit is required from the driver's compartment.

A.1.6.1.9 If, under the circumstances described in paragraph A.1.6.1.8, a driver's door is provided in vehicles of Classes A or B it may count as an emergency door for passengers provided:

A.1.6.1.9.1 The driver's door satisfies the requirements relating to the dimensions of emergency door indicated in paragraph A.1.6.3.1.2 of this annex;

A.1.6.1.9.2 The driver's door fulfils the requirements of paragraph A.1.6.1.7.2;

A.1.6.1.9.3 The space reserved for the driver's seat shall communicate with the main passengers' compartment through an appropriate passage; such requirement shall be deemed to be fulfilled if the test gauge described in paragraph A.1.7.5.1 is able to be moved unobstructed from the gangway, until the front end of the gauge reaches the vertical plane tangential to the foremost point of the driver's seat back (this seat being situated in its rearmost longitudinal position) and, from this plane, the test gauge described in paragraph A.1.7.3.3 is able to be moved to the emergency door in the direction established by such paragraph (see Annex 2, Figure 26) with seat and steering wheel adjustment in their mid-position.

A.1.6.1.10 Paragraphs A.1.6.1.8 and A.1.6.1.9, do not preclude there being a door or other barrier between the driver's seat and the passenger compartment provided that this barrier can

be released quickly by the driver in an emergency. A driver’s door in a compartment protected by such a barrier shall not be counted as an exit for passengers.

A.1.6.1.11 Vehicles of Classes II, III and B shall be fitted with escape hatches, additional to the emergency doors and windows. In the case of double-deck vehicles, these hatches shall be fitted in the upper deck roof only. The minimum number of hatches shall be:

Number of passengers (in the upper deck in the case of double-deck vehicles)	Minimum number of hatches
Not exceeding 30	1
Exceeding 30	2

Except as provided in paragraph A.1.6.1.12, hatches may also be fitted in the case of Classes I and A vehicles. There shall not be any escape hatches fitted in the roof of a trolleybus.

A.1.6.1.12 Hatches shall not be fitted in positions where technical components are installed which present possible danger to passengers using the escape hatches (e.g. high voltage systems, systems containing dangerous liquids and/or gas, etc.).

A.1.6.1.13 Each intercommunication staircase shall be considered to be an exit from the upper deck of a double-deck vehicle.

A.1.6.1.14 All persons accommodated in the lower deck of a double-deck vehicle shall, in an emergency situation, have access to the exterior of the vehicle without having to enter the upper deck.

A.1.6.1.15 The upper deck gangway of a double-deck vehicle shall be connected by one or more intercommunication staircases to the access passageway of a service door or to the lower deck gangway within 3 m of a service door:

A.1.6.1.15.1 At least one and one-half staircases shall be provided in the case of vehicles of Class I if more than 50 passengers are carried on the upper deck;

A.1.6.1.15.2 At least one and one-half staircases shall be provided in the case of vehicles of Class II and Class III if more than 30 passengers are carried on the upper deck.

A.1.6.1.16 In the case of a vehicle without a roof, the exits on the deck without a roof shall be such as to fulfil those prescriptions that are not incompatible with the absence of the roof.

A.1.6.1.17 In the case of vehicles of Class A or B, if there is a door opposite the driver's door it may count as one of the required exits for passengers provided:

A.1.6.1.17.1 There is not more than one passenger's seat beside the driver's compartment, and

A.1.6.1.17.2 It complies with the provisions of paragraph A.1.6.1.9.

A.1.6.2 Positioning of exits

A.1.6.2.1 Vehicles of Classes I, II and III shall meet the requirements shown below.

A.1.6.2.1.1 The service door(s) shall be situated on the side of the vehicle that is nearer to the side of the road corresponding to the direction of traffic for which the vehicle is designed and as declared by the manufacturer .

At least one of them shall be in the forward half of the vehicle. This shall not preclude:

A.1.6.2.1.1.1 The provision of a specially designed door in the rear or side faces of a vehicle for use in place of a service door by wheelchair passengers, or

A.1.6.2.1.1.2 The provision of an additional door in the rear face of a vehicle principally for loading/unloading of goods or luggage, but which may be used by passengers where circumstances so require, or

A.1.6.2.1.1.3 The provision of one or more additional service door(s) on the opposite side of the vehicle in the case of vehicles designed for use in circumstances which require boarding / alighting of passengers on both sides of the vehicle. Vehicles so equipped shall be provided with control(s) that allow the driver to inhibit normal operation of the doors that are not currently in use.

A.1.6.2.2 Vehicles of Classes A and B shall meet the following requirements:

A.1.6.2.2.1 The service door(s) shall be situated on the side of the vehicle that is nearer to the side of the road corresponding to the direction of the traffic for which the vehicle is designed and as declared by the manufacturer .

A.1.6.2.2.2 The exits shall be placed in such a way that there is at least one exit on each side of the vehicle.

A.1.6.2.2.3 The forward half and the rearward half of the passenger compartment shall each contain at least one exit.

A.1.6.2.3 If the passenger's compartment has an area S_0 equal or greater than 10 m^2 , two of the doors referred to in paragraph A.1.6.1.1. shall be separated such that the distance between transverse vertical planes through their centres of area is not less than:

A.1.6.2.3.1 In the case of a single deck vehicle, 40 per cent of the overall length of the passenger compartment measured parallel to the longitudinal axis of the vehicle.

In the case of an articulated vehicle, this requirement shall be fulfilled if two doors of the different sections are separated such that the distance between the doors is not less than 40 per cent of the overall length of the combined passenger compartment (all sections).

If one of these two doors forms part of a double door this distance shall be measured between the two doors which are furthest apart.

A.1.6.2.3.2 In the case of a double-deck vehicle, two of the doors referred to in paragraph A.1.6.1.1. shall be separated such that the distance between transverse vertical planes through their centres of area is not less than either 25 per cent of the overall length of the vehicle or 40 per cent of the overall length of the passenger compartment on the lower deck; this shall not apply if the two doors are on different sides of the vehicle. If one of these two doors forms part of a double door, this distance shall be measured between the two doors which are furthest apart.

A.1.6.2.4 The exits (on each deck in the case of a double-deck vehicle) shall be placed in such a way that their number on each of the two sides of the vehicle is substantially the same. (This shall not imply the need to provide additional exits over and above the number specified in paragraph A.1.6.1. above). Any exists in excess of the required minimum number need not be substantially on each of the two sides.

A.1.6.2.5 At least one exit shall be situated either in the rear face or in the front face of the vehicle:

A.1.6.2.5.1 In the case of Class I and A vehicles, the requirements of paragraph A.1.6.2.5. are fulfilled if an escape hatch is fitted; or, if paragraph A.1.6.1.12. applies, an additional exit to those specified in paragraph A.1.6.1 , is fitted on each side of the vehicle.

A.1.6.2.5.2 In the case of double-deck vehicles, the requirements of paragraph A.1.6.2.5. shall apply only to the upper deck.

A.1.6.2.6 The exits on the same side of the vehicle shall be suitably separated along the length of the passenger compartment.

A.1.6.2.7 A door shall, provided that it is not a service door, be permitted in the rear face of the vehicle.

A.1.6.2.8 Required escape hatches shall be positioned as follows:

- (a) If there is only one hatch, it shall be situated in the middle third of the passenger compartment; or
- (b) If there are two hatches, they shall be separated by a distance of at least 2 m measured between the nearest edges of the apertures in a line parallel to the longitudinal axis of the vehicle.

A.1.6.3 Minimum dimensions of exits

A.1.6.3.1 Vehicles of Class I, II or III shall meet the following requirements:

A.1.6.3.1.1 Service doors shall have an aperture creating an access in accordance with the requirements shown in paragraph A.1.7.1. of this annex.

A.1.6.3.1.2 Emergency doors shall have an aperture with a minimum height of 1,450 mm and a minimum width of 600 mm.

A.1.6.3.1.3 Emergency windows shall have a minimum area of 400,000 mm². It shall be possible to inscribe in this area a rectangle measuring 500 mm x 700 mm.

A.1.6.3.1.4 In the case of an emergency window situated in the rear face of the vehicle, either it shall meet the requirements shown in paragraph A.1.6.3.1.3. above, or it shall be possible to inscribe in the aperture of this emergency window a rectangle 350 mm high and 1,550 mm wide, the corners of which may be rounded to a radius of curvature not exceeding 250 mm.

A.1.6.3.1.5 Escape hatches shall have an aperture with a minimum area of 450,000 mm². It shall be possible to inscribe in this area a rectangle measuring 600 mm x 700 mm.

A.1.6.3.2 Vehicles of Class A or B may meet either the requirements shown in paragraph A.1.6.3.1. (Class A meeting Class I requirements and Class B meeting Class II and III requirements) or those contained in A.4.1.1 .

A.1.6.4 Technical requirements for all service doors

A.1.6.4.1 Every service door shall be capable of being easily opened from inside and from outside the vehicle when the vehicle is stationary (but not necessarily when the vehicle is moving). However, this requirement shall not be construed as precluding the possibility of locking the door from the outside, provided that the door can always be opened from the inside.

A.1.6.4.2 Every control or device for opening a door from the outside shall be between 1,000 mm and 1,500 mm from the ground and not more than 500 mm from the door. In vehicles of Classes I, II and III every control or device for opening a door from the inside shall be between 1,000 mm and 1,500 mm from the upper surface of the floor or step nearest the control and be not more than 500 mm from the door. This shall not apply to controls located within the driver's area.

A.1.6.4.3 Every one-piece manually-operated service door which is hinged or pivoted shall be so hinged or pivoted that if the open door comes into contact with a stationary object while the vehicle is moving forwards it tends to close.

A.1.6.4.4 If a manually-operated service door is fitted with a slam lock it shall be of the two-stage type.

A.1.6.4.5 On the inside of a service door there shall not be any device intended to cover the inside steps when the door is closed. This does not exclude the presence in the step well, when the door is closed, of the door operating mechanism and other equipment attached to the inside of the door which does not form an extension of the floor on which passengers may stand. This mechanism and equipment should not be dangerous for the passengers.

A.1.6.4.6 If the direct view is not adequate, optical or other devices shall be installed to enable the driver to detect from his seat the presence of a passenger in the immediate interior

and exterior vicinity of every side service door which is not an automatically-operated service door.

In the case of double-deck vehicles of Class I, this requirement also applies to the interior of all service doors and to the immediate vicinity of each intercommunication staircase on the upper deck.

In the case of a service door in the rear face of the vehicle not exceeding 22 passengers, this requirement is satisfied if the driver is able to detect the presence of a person 1.3 m tall standing 1 m behind the vehicle.

Driving mirrors may be used to meet the requirements of this paragraph provided that the field of view required for driving is still met.

In the case of doors situated behind the articulated section of an articulated vehicle, mirrors shall not be deemed to be a sufficient optical device.

A.1.6.4.7 Every door which opens towards the interior of the vehicle and its mechanism shall be so constructed that its movement is not likely to cause injury to passengers in normal conditions of use. Where necessary, appropriate protection devices shall be fitted.

A.1.6.4.8 If a service door is located adjacent to a door to a toilet or other internal compartment the service door shall be proofed against unintentional operation. However, this requirement shall not apply if the door is locked automatically when the vehicle is moving at a speed exceeding 5 km/h.

A.1.6.4.9 In the case of vehicles having a capacity not exceeding 22 passengers, the service doors of which are in the rear face of the vehicle, the leaves shall not be capable of being opened more than 115° nor less than 85° and, when open, shall be capable of being held automatically in that position. This does not preclude the ability to override that stop and open the door beyond that angle when it is safe to do so; for example, to enable reversing against a high platform for loading or to open the doors through 270° to allow a clear loading area behind the vehicle.

A.1.6.4.10 The service door in any open position shall not obstruct the use of, or required access to, any mandatory exit.

A.1.6.4.11 If an overnight locking system is provided, the following shall apply:

A.1.6.4.11.1 The locking system shall have been automatically deactivated when the ignition is in the "ON" position, or

A.1.6.4.11.2 A warning shall be provided to the driver indicating that the overnight locking system remains in operation at one or more door(s) when the ignition is in the "ON" position. One signal may be used for more than one door.

A.1.6.5 Additional technical requirements for power-operated service doors

A.1.6.5.1 In the event of an emergency, every power-operated service door shall be capable, when the vehicle is stationary or driving at a speed less than or equal to 3 km/h, of being opened from inside and, when not locked, from outside by controls which, whether or not the power supply is operating:

A.1.6.5.1.1 Override all other door controls;

A.1.6.5.1.2 In the case of interior controls, are placed on, or within 300 mm of, the door, at a height (except in the case of interior controls for the door referred to in A.5.3.9.1) of not less than 1,000 mm above the first step;

A.1.6.5.1.3 Can be easily seen and clearly identified when approaching the door and when standing in front of the door and, if additional to the normal opening controls, be clearly marked for emergency use;

A.1.6.5.1.4 Can be operated by one person when standing immediately in front of the door;

A.1.6.5.1.5 May activate a starting prevention device;

A.1.6.5.1.6 Cause the door to open to a width that the gauge as defined in paragraph A.1.7.1.1. can pass through within 8 seconds after the operation of the control, or enable the door to be easily opened by hand to a width that the gauge as defined in paragraph A.1.7.1.1. can pass through within 8 seconds after the operation of the control;

A.1.6.5.1.7 May be protected by a device which can be easily removed or broken to gain access to the emergency control; the operation of the emergency control, or the removal of a protective cover over the control, shall be indicated to the driver both audibly and visually, and

A.1.6.5.1.8 In the case of a driver-operated door which does not comply with the requirements of paragraph A.1.6.5.6.2 , shall be such that after they have been operated to open the door and returned to their normal position, the door will not close again until the driver subsequently operates a closing control.

A.1.6.5.1.9 In the case of interior controls, shall be deactivated if the vehicle moves at a speed higher than 3 km/h. This requirement may be applied to exterior controls.

A.1.6.5.2 A device may be provided which is operated by the driver from the driving seat to deactivate the outside emergency controls in order to lock the service doors from outside. In this case, the outside emergency controls shall be reactivated automatically either by the starting of the engine or before the vehicle reaches a speed of 20 km/h. Subsequently, deactivation of the outside emergency controls shall not occur automatically, but shall require a further action by the driver.

A.1.6.5.3 Every driver-operated service door shall be capable of operation by the driver when in the driving seat using controls which, except in the case of a foot control, are clearly and distinctively marked.

A.1.6.5.4 Every power-operated service door shall activate a visual tell-tale, which shall be plainly visible to the driver when seated in the normal driving position in any normal ambient lighting condition, to warn that a door is not fully closed. This tell-tale shall signal whenever the rigid structure of the door is between the fully open position and a point 30 mm from the fully closed position. One tell-tale may serve for one or more doors. However, no such tell-tale shall be fitted in respect of a front service door which does not comply with the requirements of paragraphs A.1.6.5.6.1.1. and A.1.6.5.6.1.2.

A.1.6.5.5 Where controls are provided for the driver to open and close a power-operated service door, they shall be such that the driver is able to reverse the movement of the door at any time during the closing or opening process.

A.1.6.5.6 The construction and control system of every power-operated service door shall be such that a passenger is unlikely to be injured by the door or trapped in the door as it closes.

A.1.6.5.6.1 This requirement shall be considered satisfied if the following two requirements are met:

A.1.6.5.6.1.1 The first requirement is that when the closing of the door at any measuring point described in Annex 6 is resisted by a clamping force not exceeding 150 N, the door shall reopen automatically to its fullest extent and, except in the case of an automatically-operated service door, remain open until a closing control is operated. The clamping force may be measured by any method to the satisfaction of the Type Approval Authority. Guidelines are given in Annex 6 to this standard. The peak force may be higher than 150 N for a short time provided that it does not exceed 300 N. The reopening system may be checked by means of a test bar having a section of height 60 mm, width 30 mm with corners radiused to 5 mm.

A.1.6.5.6.1.2 The second requirement is that whenever the doors are closed onto the wrist or fingers of a passenger:

A.1.6.5.6.1.2.1 The door reopens automatically to its fullest extent and, except in the case of an automatically-operated service door, remains open until a closing control is operated, or

A.1.6.5.6.1.2.2 The wrist or fingers can be readily extracted from the doors without risk of injury to the passenger. This requirement may be checked by hand, or by means of the test bar mentioned in paragraph A.1.6.5.6.1.1 , tapered at one end over a length of 300 mm from a thickness of 30 mm to a thickness of 5 mm. It shall not be treated with polish nor lubricated. If the door traps the bar it shall be capable of being easily removed, or

A.1.6.5.6.1.2.3 The door is maintained at a position allowing the free passage of a test bar having a section of height 60 mm, width 20 mm, with corners radiused to 5 mm. This position shall not be more than 30 mm distant from the fully closed position.

A.1.6.5.6.2 In the case of a front service door the requirement of paragraph A.1.6.5.6. shall be considered satisfied if the door:

A.1.6.5.6.2.1 Fulfils the requirements of paragraphs A.1.6.5.6.1.1 and A.1.6.5.6.1.2 , or

A.1.6.5.6.2.2 Is fitted with soft edges; these shall not, however be so soft that if the doors are closed on the test bar mentioned in paragraph A.1.6.5.6.1.1 the rigid structure of the doors will reach the fully closed position.

A.1.6.5.7 Where a power-operated service door is held closed only by the continued application of the power supply there shall be provided a visual warning device to inform the driver of any failure in the power supply to the doors.

A.1.6.8 A starting prevention device, if fitted, shall be effective only at speeds of less than 5 km/h and shall be incapable of operation above that speed.

A.1.6.9 If the vehicle is not fitted with a starting prevention device, an audible warning to the driver shall be activated if the vehicle is driven away from rest when any power-operated service door is not fully closed. This audible warning shall be activated at a speed exceeding 5 km/h for doors complying with the requirements of paragraph A.1.6.5.6.1.2.3 .

A.1.6.6 Additional technical requirements for automatically-operated service doors

A.1.6.6.1 Activation of the opening controls.

A.1.6.6.1.1 Except as provided in paragraph A.1.6.5.1 , the opening controls of every automatically-operated service door shall be capable of being activated and deactivated only by the driver from his seat.

A.1.6.6.1.2 Activation and deactivation may be either direct, by means of a switch, or indirect, for example by opening and closing the front service door.

A.1.6.6.1.3 Activation of the opening controls by the driver shall be indicated inside and, where a door is to be opened from outside, also on the outside of the vehicle; the indicator (e.g. illuminated push-button, illuminated sign) shall be on or adjacent to the door to which it relates.

A.1.6.6.1.4 In the case of direct actuation by means of a switch the functional state of the system shall be clearly indicated to the driver, by, for example, the position of the switch or an indicator lamp or an illuminated switch. The switch shall be specially marked and arranged in such a way that it cannot be confused with other controls.

A.1.6.6.2 Opening of automatically-operated service doors.

A.1.6.6.2.1 After activation of the opening controls by the driver it shall be possible for passengers to open the door as follows:

A.1.6.6.2.1.1 From inside, for example by pressing a push-button or passing a light barrier, and

A.1.6.6.2.1.2 From outside, except in the case of a door intended only as an exit and marked as such, by, for example, pressing an illuminated push-button, a push-button beneath an illuminated sign, or a similar device marked with a suitable instruction.

A.1.6.6.2.2 The pressing of the push-buttons mentioned in paragraph A.1.6.6.2.1.1 , and the use of the means of communication with the driver mentioned in paragraph A.1.7.9.1 , may send a signal which is stored and which, after the activation of the opening controls by the driver, effects the opening of the door.

A.1.6.6.3 Closing of automatically-operated service doors.

A.1.6.6.3.1 When an automatically-operated service door has opened it shall close again automatically after a time interval has elapsed. If a passenger enters or leaves the vehicle during this time interval, a safety device (e.g. a footboard contact, light barrier, one-way gate) shall ensure that the time until the door closes is sufficiently extended.

A.1.6.6.3.2 If the passenger enters or leaves the vehicle while the door is closing, the closing process shall be interrupted automatically and the door shall return to the open position. The reversal may be actuated by one of the safety devices referred to in paragraph A.1.6.6.3.1 or by any other device.

A.1.6.6.3.3 A door that has closed automatically in accordance with paragraph A.1.6.6.3.1 shall be capable of being opened again by a passenger in accordance with paragraph A.1.6.6.2 ; this shall not apply if the driver has deactivated the opening controls.

A.1.6.6.3.4 After deactivation of the opening controls of the automatically-operated service doors by the driver, open doors shall close in accordance with paragraphs A.1.6.6.3.1 and A.1.6.6.3.2 .

A.1.6.6.4 Inhibition of the automatic closing process on doors marked for special service, e.g. for passengers with prams, passengers with reduced mobility, etc.

A.1.6.6.4.1 The driver shall be able to inhibit the automatic closing process by actuation of a special control. A passenger shall also be able to inhibit the automatic closing process directly by pressing a special push-button.

A.1.6.6.4.2 The inhibition of the automatic closing process shall be indicated to the driver, e.g. by a visual tell-tale.

A.1.6.6.4.3 Re-establishment of the automatic closing process shall in any case be capable of being done by the driver.

A.1.6.6.4.4 Paragraph A.1.6.6.3 shall apply to the subsequent closing of the door.

A.1.6.7 Technical requirements for emergency doors

A.1.6.7.1 Emergency doors shall be capable of being easily opened from inside and from outside when the vehicle is stationary. However, this requirement shall not be construed as precluding the possibility of locking the door from the outside, provided that the door can always be opened from the inside by the use of the normal opening mechanism.

A.1.6.7.2 Emergency doors, during their use as such, shall not be of the power-operated type unless, once either a service door control prescribed in paragraph A.1.6.5.1 , or a control for a dedicated emergency door complying with the provisions of paragraph A.1.6.5.1 has been actuated and returned to its normal position, the doors do not close again until the driver subsequently operates a closing control. Activation of one of the controls prescribed in paragraph A.1.6.5.1 shall cause the door to open to a width that the gauge as defined in paragraph A.1.7.2.1 can pass through within a maximum of 8 seconds after the operation of the control, or enable the door to be easily opened by hand to a width that the gauge can pass through within a maximum of 8 seconds after the operation of the control. In addition emergency doors shall not be of the sliding type except in the case of vehicles having a

capacity not exceeding 22 passengers. For these vehicles a sliding door, which has been shown to be capable of being opened without the use of tools after a frontal barrier collision test in accordance with standard No. 33, can be accepted as an emergency door.

A.1.6.7.3 Every control or device for opening an emergency door (on the lower deck in the case of a double-deck vehicle) from the outside shall be between 1,000 mm and 1,500 mm from the ground and not more than 500 mm from the door. In vehicles of Classes I, II and III every control or device for opening an emergency door from the inside shall be between 1,000 mm and 1,500 mm from the upper surface of the floor or step nearest to the control and be not more than 500 mm from the door. This shall not apply to controls located within the driver's area.

Alternatively, the control referred to in paragraph A.1.6.7.2 for opening a power-operated door may be placed according to paragraph A.1.6.5.1.2 .

A.1.6.7.4 Hinged emergency doors fitted to the side of the vehicle shall be hinged at their forward edge and shall open outwards. Check straps, chains or other restraining devices shall be permitted, provided that they do not prevent the door from opening to, and remaining open at, an angle of at least 100 degrees. If a means is provided sufficient to give free passage to the emergency door access gauge, the 100 degrees minimum angle requirement shall not apply.

A.1.6.7.5 Emergency doors shall be proofed against unintentional operation. However, this requirement shall not apply if the emergency door is locked automatically when the vehicle is moving at a speed exceeding 5 km/h.

A.1.6.7.6 All emergency doors shall be provided with an audible device to warn the driver when they are not securely closed. The warning device shall be operated by movement of the door catch or handle and not by movement of the door itself.

A.1.6.7.7 If an overnight locking system is provided, the following shall apply:

A.1.6.7.7.1 The locking system shall have been automatically deactivated when the ignition is in the "ON" position, or

A.1.6.7.7.2 A warning shall be provided to the driver indicating that the overnight locking system remains in operation at one or more door(s) when the ignition is in the "ON" position. One signal may be used for more than one door.

A.1.6.8 Technical requirements for emergency windows

A.1.6.8.1 Every hinged or ejectable emergency window shall open outwards. Ejectable types shall not become totally detached from the vehicle when operated. The operation of ejectable windows shall be such that inadvertent ejection is effectively prevented.

A.1.6.8.2 Every emergency window shall either:

A.1.6.8.2.1 Be capable of being easily and instantaneously operated from inside and from outside the vehicle by means of a device recognised as satisfactory. This provision includes the possibility of using e.g. panes of laminated glass or plastic material, or"

A.1.6.8.2.2 Be made of readily-breakable safety glass. This latter provision precludes the possibility of using panes of laminated glass or of plastic material. A device shall be provided adjacent to each emergency window, readily available to persons inside the vehicle, to ensure that each window can be broken. The device for breaking the glass for the emergency windows at the rear of the vehicle shall be positioned either centrally above or below the emergency window or, alternatively, a device shall be positioned adjacent to each end of the window.

A.1.6.8.3 Every emergency window which can be locked from the outside shall be so constructed as to be capable of being opened at all times from inside the vehicle.

A.1.6.8.4 If the emergency window is of a type horizontally hinged at the top edge, an appropriate device shall be provided to hold it fully open. Every hinged emergency window shall operate so as not to obstruct clear passage from inside or outside the vehicle.

A.1.6.8.5 The height of the lower edge of an emergency window fitted in the side of the vehicle from the general level of the floor immediately below it (excluding any local variations such as the presence of a wheel or transmission housing) shall be not more than 1,200 mm nor less than 650 mm in the case of a hinged emergency window, or 500 mm in the case of a window made of breakable glass.

However, in the case of a hinged emergency window, the height of the lower edge may be reduced to a minimum of 500 mm provided that the window aperture is equipped with a guard up to a height of 650 mm to prevent the possibility of passengers falling out of the vehicle. Where the window aperture is equipped with a guard, the size of the window aperture above the guard shall not be less than the minimum size prescribed for an emergency window.

A.1.6.8.6 Every hinged emergency window which is not clearly visible from the driver's seat shall be fitted with an audible warning device to warn the driver when it is not completely closed. The window lock, and not the movement of the window itself, shall actuate this device.

A.1.6.9 Technical requirements for escape hatches

A.1.6.9.1 Every escape hatch shall operate so as not to obstruct the clear passage from inside or outside the vehicle.

A.1.6.9.2 Roof escape hatches shall be ejectable, hinged or made of readily-breakable safety glass. Floor hatches shall be either hinged or ejectable and shall be fitted with an audible warning device to warn the driver when it is not securely closed. The floor escape hatch lock, and not the movement of the hatch itself, shall actuate this device. Floor escape hatches shall be proofed against unintentional operation. However this requirement shall not apply if the floor hatch is locked automatically when the vehicle is moving at a speed exceeding 5 km/h.

A.1.6.9.3 Ejectable types shall not become totally detached from the vehicle when operated such that the hatch is not a danger to other road users. The operation of ejectable escape hatches shall be such that inadvertent operation is effectively prevented. Floor ejectable hatches shall eject only into the passenger compartment.

A.1.6.9.4 Hinged escape hatches shall hinge along the edge towards the front or rear of the vehicle and shall hinge through an angle of at least 100 degrees. Hinged floor escape hatches shall hinge into the passenger compartment.

A.1.6.9.5 Escape hatches shall be capable of being easily opened or removed from the inside and from the outside. However, this requirement shall not be construed as precluding the possibility of locking the escape hatch for the purpose of securing the vehicle when unattended, provided that the escape hatch can always be opened or removed from the inside by the use of the normal opening or removal mechanism. In the case of a readily-breakable hatch, a device shall be provided adjacent to the hatch, readily available to persons inside the vehicle, to ensure that the hatch can be broken.

A.1.6.10 Technical requirements for retractable steps

Retractable steps if fitted shall comply with the following requirements:

A.1.6.10.1 The operation of retractable steps may be synchronised with that of the corresponding service or emergency door ;

A.1.6.10.2 When the door is closed no part of the retractable step shall project more than 10 mm beyond the adjacent line of the body work;

A.1.6.10.3 When the door is open and the retractable step is in the extended position, the surface area shall conform to the requirements of paragraph A.1.7.7 of this annex;

A.1.6.10.4 In the case of a power-operated step, it shall not be possible for the vehicle to move from rest, under its own power, when the step is in the extended position. In the case of a manually operated step, an audible indication shall alert the driver when the step is not fully retracted.

A.1.6.10.5 A power-operated step shall not be capable of being extended when the vehicle is in motion. If the device to operate the step fails, the step shall retract and remain in the retracted position. However, the operation of the corresponding door shall not be hindered in the event of such a failure or by the step being damaged or obstructed.

A.1.6.10.6 when a passenger is standing on a power-operated retractable step, the corresponding door shall be incapable of being closed. Compliance with this requirement shall be checked by placing a mass of 15 kg, representing a small child, at the centre of the step. This requirement shall not apply to any door within the driver’s direct field of view.

A.1.6.10.7 (Reserved)

A.1.6.10.8 The corners of retractable steps facing forwards or rearwards shall be rounded to a radius of not less than 5 mm; the edges shall be rounded to a radius of not less than 2.5 mm;

A.1.6.10.9 When the passenger door is open, the retractable step shall be securely held in the extended position. When a mass of 136 kg is placed in the centre of a single step or a mass of 272 kg is placed in the centre of a double step the deflection at any point on the step, measured relative to the body of vehicle, shall not exceed 10 mm.

A.1.6.11 Safety signs

A.1.6.11.1 All safety signs shall comply with requirements contained in paragraph 6.5. of GSO ISO 3864-1:2017.

A.1.6.11.2 Each safety sign required by this standard shall be used to communicate only one safety message. The information provided shall be in the form of pictograms, however, words, letters and numbers may supplement the pictogram in combination on the same sign. It shall be located and orientated so as to be easily understood.

A.1.6.11.2.1 Safety signs shall follow the principles shown in the example layouts below, i.e. a header section depicting the safety message, a second section containing instructional information and a third, optional, footer section for non-critical text.

A.1.6.11.2.2 Pictograms indicating required actions by the user shall show a person, or the relevant part of a person, operating the equipment or device.

A.1.6.11.2.3 Pictograms indicating a required movement shall, where appropriate, show an arrow pointing in the direction of motion. Where a rotational movement is required, a curved arrow shall be used.

A.1.6.11.2.4 Where devices are to be operated, panels removed or doors opened, the pictogram shall indicate the action in progress.

A.1.6.11.2.5 The lower case letter(s) of supplementary words, single letters and numbers shall have a minimum height of 8 mm. Words shall not be in upper case letters only.

A.1.6.11.3 All safety signs that are visible from the inside of the vehicle shall be of photoluminescent material having luminance decay characteristics conforming, as a minimum, to sub-classification C in Table 2 of GSO ISO 17398:2017, when measured in accordance with paragraph 7.11. of that standard.

A.1.6.11.4 Safety signs shall not be located in positions where they may be obscured during operation of the vehicle. However, a curtain or blind may be positioned over an emergency window provided an additional safety sign indicates that the emergency window is located behind the curtain or blind.

A.1.6.11.5 Each emergency exit, and any other exit that meets the prescriptions for an emergency exit, shall be marked by one of the relevant pictograms described in Table 3 of GSO ISO 7010:2016; pictograms shall be legible from both the inside and the outside of the vehicle.

A.1.6.11.6 Safety signs shall be positioned adjacent to, or surround, or be on, all internal and external emergency controls and device(s) for breaking emergency window(s).

A.1.6.11.7 No part of a safety sign shall obscure any misuse protection that may be present, e.g. a cover.

A.1.6.11.8 The language in which any textual safety sign intended to comply with paragraphs A.1.6.11.1 to A.1.6.11.7.

A.1.6.12 Service-door lighting

A.1.6.12.1 Service-door lighting may be provided to illuminate the flat, horizontal portion of the ground defined in paragraph A.1.6.12.2.2 so as to aid passengers boarding and alighting the vehicle and to enable the presence of a passenger within this portion of the ground to be detected by the driver from his seat.

A.1.6.12.2 Service-door lighting, if fitted, shall:

A.1.6.12.2.1 Be of white colour;

A.1.6.12.2.2 Illuminate a flat, horizontal portion of the ground having a width of 2 m measured from a plane parallel to the median longitudinal vertical plane of the vehicle which passes through the outermost point of the closed service door and over a length extending from a transverse plane which passes through the foremost edge of the closed service door to a transverse plane passing through the centre line of the foremost wheels situated to the rear of the service door, or, in the case where there are no such wheels, to a transverse plane passing through the rear of the vehicle;

A.1.6.12.2.3 Have limited dazzle outside a zone on the ground having a maximum width of 5 m measured from the side of the vehicle and a maximum length limited by a transverse plane passing through the front of the vehicle and a transverse plane passing through the rear of the vehicle;

A.1.6.12.2.4 If the lower edge of the lighting device is less than 2 m from the ground, not project more than 50 mm beyond the overall width of the vehicle measured without this device and have radii of curvature of not less than 2.5 mm;

A.1.6.12.2.5 Be activated and deactivated manually by a separate switch; and

A.1.6.12.2.6 Be installed so that the device can only be switched on when a service door is operated and the vehicle speed does not exceed 5 km/h and is switched off automatically before the vehicle reaches a speed exceeding 5 km/h.

A.1.7 Interior arrangements

A.1.7.1 Access to service doors (see Annex 2, Figure 1)

A.1.7.1.1 The free space extending inwards into the vehicle from the side wall in which the door is mounted shall permit the free passage of one test gauge having the dimensions of either test gauge 1 or test gauge 2 specified in Annex 2, Figure 1.

The test gauge shall be maintained parallel with the door aperture as it is moved from the starting position, where the plane of the face nearest to the interior of the vehicle is tangential to the outermost edge of the aperture, to the position where it touches the first step, after which it shall be kept at right angles to the probable direction of motion of a person using the entrance.

A.1.7.1.2 (Reserved).

A.1.7.1.3 When the centre line of this test gauge has traversed a distance of 300 mm from its starting position and the test gauge is touching the surface of the step or floor, it shall be retained in that position.

A.1.7.1.4 The cylindrical figure (see Annex 2, Figure 6) used for testing the gangway clearance shall then be moved starting from the gangway, in the probable direction of motion of a person leaving the vehicle, until its centre line has reached the vertical plane which contains the top edge of the uppermost step, or until a plane tangential to the upper cylinder touches the dual panel, whichever occurs first, and retained in that position (see Annex 2, Figure 2).

A.1.7.1.5 Between the cylindrical figure, at the position set out in paragraph A.1.7.1.4, and the dual panel, at the position set out in paragraph A.1.7.1.3, there shall be a free space whose upper and lower limits are shown in Annex 4, Figure 2. This free space shall permit the free

passage of a vertical panel whose form and dimensions are the same as the cylindrical form (paragraph A.1.7.5.1), central section and a thickness of no more than 20 mm. This panel shall be moved, from the cylindrical form tangential position, until its external side is in contact with the dual panel interior side, touching the plane or planes defined by the step upper edges, in the probable direction of motion of a person using the entrance (see Annex 4, Figure 2).

A.1.7.1.6 The free passage clearance for this figure shall not include any space extending to 300 mm in front of any uncompressed seat cushion of a forward or rearward facing seat, or 225 mm in the case of sideways-facing seats and to the height of the top of the seat cushion (see Annex 4, Figure 25).

A.1.7.1.7 In the case of folding seats, this space shall be determined with the seat in the position of use.

A.1.7.1.8 However, one or more folding seat(s) for use by the crew may obstruct the access passage to a service door when in the position of use provided that:

A.1.7.1.8.1 It is clearly indicated, both in the vehicle itself and on the communication form (see Annex 1), that the seat is for the use of crew only;

A.1.7.1.8.2 When the seat is not in use it folds automatically as necessary to enable the requirements of paragraphs A.1.7.1.1 or A.1.7.1.2 and A.1.7.1.3 , A.1.7.1.4 and A.1.7.1.5 of this annex to be met;

A.1.7.1.8.3 The door is not considered to be a mandatory exit for the purpose of paragraph A.1.6.1.4 of this annex;

A.1.7.1.8.4 When the seat is in the position of use, and when it is in the folded position, no part of it shall be:

(a) Forward of a vertical plane passing through the centre of the seating surface of the driver's seat in its rearmost and lowest position and through the centre of the exterior rear-view mirror mounted on the opposite side of the vehicle or through the centre of any monitor used as device for indirect vision, whatever applicable,
and

(b) Above a horizontal plane which is located 300 mm above the centre of the seating surface of the driver's seat in its rearmost and lowest position.

A.1.7.1.9 In the case of vehicles having a capacity not exceeding 22 passengers a doorway and the route by which passengers gain access to it shall be considered unobstructed if they have:

A.1.7.1.9.1 Measured parallel with the longitudinal axis of the vehicle, there is a clearance of not less than 220 mm at any point and 550 mm at any point being more than 500 mm above the floor or steps (Annex 2, Figure 3).

A.1.7.1.9.2 Measured perpendicular to the longitudinal axis of the vehicle, there is a clearance of not less than 300 mm at any point and 550 mm at any point being more than 1,200 mm above the floor or steps or less than 300 mm below the ceiling (Annex 2, Figure 4).

A.1.7.1.10 The service door and emergency door dimensions in paragraph A.1.6.3.1 and the requirements of paragraphs A.1.7.1.1 to A.1.7.1.7, A.1.7.2.1 to A.1.7.2.3, A.1.7.5.1 and A.1.7.8.5. of this annex shall not apply to a vehicle of class B with a technically permissible maximum mass not exceeding 3.5 tonnes and up to 12 passenger seats in which each seat has unobstructed access to at least two doors.

A.1.7.1.11 The maximum slope of the floor in the access passage shall not exceed 5 per cent.

A.1.7.1.12 The surface of access passages shall be slip-resistant.

A.1.7.2 Access to emergency doors (see Annex 2, Figure 5)

The following requirements shall not apply to driver's doors used as emergency exits in vehicles having a capacity not exceeding 22 passengers.

A.1.7.2.1 Except as provided for in paragraph A.1.7.2.4, the free space between the gangway and the emergency door aperture shall permit the free passage of a vertical cylinder 300 mm in diameter and 700 mm high from the floor and supporting a second vertical cylinder 550 mm in diameter, the aggregate height of the assembly being 1,400 mm.

The diameter of the upper cylinder may be reduced at the top to 400 mm when a chamfer not exceeding 30 degrees from the horizontal is included.

A.1.7.2.2 The base of the first cylinder shall be within the projection of the second cylinder.

A.1.7.2.3 Where folding seats are installed alongside this passage, the free space for the cylinder shall be required to be determined when the seat is in the position for use.

A.1.7.2.4 As an alternative to the dual cylinder, the gauging device described in paragraph A.1.7.5.1 may be used (see Annex 2, Figure 6).

A.1.7.3 Access to emergency windows

A.1.7.3.1 It shall be possible to move a test gauge from the gangway to the exterior of the vehicle through every emergency window.

A.1.7.3.2 The direction of motion of the test gauge shall be in the direction in which a passenger evacuating the vehicle would be expected to move. The test gauge shall be kept perpendicular to that direction of motion and shall not meet any obstacle.

A.1.7.3.3 The test gauge shall be in the form of a thin plate having a size of 600 mm x 400 mm with corners radiused by 200 mm. However, in the case of an emergency window in the rear face of the vehicle, the test gauge may alternatively have a size of 1400 mm x 350 mm with corners radiused by 175 mm.

A.1.7.4 Access to escape hatches

A.1.7.4.1 Escape hatches in the roof

A.1.7.4.1.1 Except in the case of Class I and A vehicles, at least one escape hatch shall be located such that a four-sided truncated pyramid having a side angle of 20 degrees and a height of 1,600 mm touches part of a seat or equivalent support. The axis of the pyramid shall be vertical and its smaller section shall contact the aperture area of the escape hatch. Supports may be foldable or movable provided they can be locked in their position of use. This position shall be taken for verification.

A.1.7.4.1.2 When the structural thickness of the roof is more than 150 mm, the smaller section of the pyramid shall contact the aperture area of the escape hatch at the level of the outside surface of the roof.

A.1.7.4.2 Escape hatches in the floor.

In the case of an escape hatch fitted in the floor, the hatch shall give direct and free access to the exterior of the vehicle and be fitted where there is a clear space above the hatch equivalent to the height of the gangway. Any heat source or moving components shall be at least 500 mm from any part of the hatch aperture.

It shall be possible to move a test gauge in the form of a thin plate having dimensions 600 mm x 400 mm with corners radiused by 200 mm in a horizontal position from a height above the floor of the vehicle of 1 m to the ground.

A.1.7.5 Gangways (see Annex 2, Figure 6)

A.1.7.5.1 The gangway(s) of a vehicle shall be so designed and constructed as to permit the free passage of a gauging device consisting of two co-axial cylinders with an inverted

truncated cone interposed between them, the gauging device having the dimensions shown in Annex 2, Figure 6.

The gauging device may come into contact with strap hangers, if fitted, or other flexible objects such as seat belt components and move them easily away.

In vehicles of Classes I and A, the gauging device according to Annex 2, Figure 6 shall not come into contact with any monitor or display device mounted from the ceiling above the gangway.

In vehicles of Classes II, III and B, the gauging device according to Annex 4, Figure 6 may come into contact with any monitor or display device mounted from the ceiling above the gangway. The maximum force necessary to move any such monitor or display device out of the way, in both directions, shall not exceed 35 Newton. This maximum force shall be applied normal to the middle of the lower edge of the monitor or display device in both directions in turn until the monitor or display device has reached a position which allows clear passage of the gauging device. After being moved out of the way, the monitor or display device shall maintain its position and not automatically redeploy.

If a vehicle of Class I, II or A is fitted with a barrier, the gauging device according to Annex 4, Figure 6, may come into contact with the barrier provided that the maximum force necessary to move such barrier out of the way does not exceed 50 Newton measured at the point of contact between the gauging device according to Annex 4, Figure 6 and the barrier and applied perpendicular to the barrier.

The maximum force shall apply to both directions of movement of the gauging device.

If the vehicle is equipped with a lift adjacent to the barrier, the barrier may be temporarily blocked during the operation of the lift.

A.1.7.5.1.1 If there is no exit forward of a seat or row of seats

A.1.7.5.1.1.1 In the case of forward-facing seats, the front edge of the cylindrical gauge defined in paragraph A.1.7.5.1 shall reach at least until the transverse vertical plane tangential to the foremost point of the foremost front row seat back and be retained in that position.

From this plane, it shall be possible to move the panel shown in Annex 2, Figure 7, in such a way that starting from the contact position with the cylindrical gauge, the panel side facing the exterior of the vehicle is displaced forwards a distance of 660 mm.

A.1.7.5.1.1.2 In the case of sideways facing seats, the forward part of the cylindrical gauge shall reach at least the transversal plane which coincides with a vertical plane passing through the centre of the forward seat. (Annex 2, Figure 7).

A.1.7.5.1.1.3 In the case of rearward facing seats, the forward part of the cylindrical gauge shall reach at least the transverse vertical plane tangential to the face of the seat cushions of the forward row or seat (Annex 2, Figure 7).

A.1.7.5.2 (Reserved)

A.1.7.5.3 On vehicles of Class III the seats on one side or on both sides of the gangway may be movable laterally, it being then possible to reduce the width of the gangway to a figure corresponding to a lower cylinder diameter of 220 mm, on condition that the operation of a control on each seat, readily accessible to a person standing in the gangway, shall be sufficient to cause the seat to return easily and, if possible, automatically, even when it is loaded, to the position corresponding to a minimum width of 300 mm.

A.1.7.5.4 On articulated vehicles, the gauging device defined in paragraph A.1.7.5.1 shall be able to pass unobstructed through the articulated section on any deck where the two sections permit through passage by passengers. No part of the soft covering of that section, including parts of bellows, shall project into the gangway.

A.1.7.5.5 Steps may be fitted in the gangways. The width of such steps shall not be less than the width of the gangway at the top of the steps.

A.1.7.5.6 Folding seats allowing passengers to sit in the gangway shall not be permitted. Folding seats shall, however, be permitted in other areas of the vehicle so long as they do not obstruct the passage down the gangway of the gangway test gauge when in the open (seating) position.

A.1.7.5.7 Laterally-sliding seats which in one position encroach on the gangway shall not be permitted except on vehicles of Class III and subject to the conditions prescribed in paragraph A.1.7.5.3.

A.1.7.5.8 In the case of vehicles to which paragraph A.1.7.1.9. of this annex applies, a gangway shall not be necessary provided the access dimensions specified in that paragraph are respected.

A.1.7.5.9 The surface of gangways shall be slip-resistant.

A.1.7.6 Slope of gangway

The slope of the gangway shall not exceed:

A.1.7.6.1 In the longitudinal direction:

A.1.7.6.1.1 Eight per cent in the case of a vehicle of Class I, II or A, or

A.1.7.6.1.2 12.5 per cent in the case of a vehicle of Classes III and B, and

A.1.7.6.2 In the transversal direction, 5 per cent for all classes.

A.1.7.7 Steps (see Annex 2, Figure 8)

A.1.7.7.1 The maximum and minimum height, and the minimum depth, of steps for passengers at service and emergency doors, and within the vehicle, are specified in Annex 2, Figure 8.

A.1.7.7.1.1 Any transition from a sunken gangway to a seating area shall not be considered to be a step. However, the vertical distance between the gangway surface and the floor of the seating area shall not exceed 350 mm.

A.1.7.7.2 The height of a step shall be measured at the centre of its width at the outer edge, the tyre equipment and pressure being as specified by the manufacturer for the technically permissible maximum laden mass (M).

A.1.7.7.3 The height of the first step in relation to the ground shall be measured with the vehicle on level ground, at its mass in running order as defined in paragraph 2.18. of this standard, and the tyre equipment and pressure being as specified by the manufacturer for the technically permissible maximum laden mass (M) declared in accordance with paragraph 2.19. of this standard.

A.1.7.7.4 Where there is more than one step, each step may extend into the area of the vertical projection of the next step by up to 100 mm and the projection over the tread below shall leave a free surface of at least 200 mm (see Annex 2, Figure 8) with all step nosings being designed such as to minimize the risk of tripping. All step nosings shall contrast visually with their immediate surroundings.

A.1.7.7.5 The width and shape of every step shall be such that a rectangle as indicated in the table below can be placed on that step with not more than 5 per cent of the area of the appropriate rectangle overhanging the step. At a double doorway each half of the doorway shall fulfil this requirement.

<i>Number of passengers</i>		<i>> 22</i>	<i>≤ 22</i>
Area	First step (mm)	400 x 300	400 x 200

<i>Number of passengers</i>		<i>> 22</i>	<i>≤ 22</i>
	Other steps (mm)	400 x 200	400 x 200

A.1.7.7.6 All steps shall have a slip-resistant surface.

A.1.7.7.7 The maximum slope of the step in any direction shall not exceed 5 per cent.

A.1.7.8 Passenger seats (including folding seats) and space for seated passengers

A.1.7.8.1 Minimum seat width (see Annex 2, Figure 9)

A.1.7.8.1.1 The minimum width of the seat cushion, dimension "F" (Annex 2, Figure 9), measured from a vertical plane passing through the centre of that seating position, shall be:

A.1.7.8.1.1.1 200 mm in the case of Class I, II, A or B; or

A.1.7.8.1.1.2 225 mm in the case of Class III.

A.1.7.8.1.2 The minimum width of the available space for each seating position, dimension "G" (Annex 2, Figure 9), measured from a vertical plane passing through the centre of that seating position at height between 270 mm and 650 mm above the uncompressed seat cushion, shall be not less than:

A.1.7.8.1.2.1 250 mm in the case of individual seats; or

A.1.7.8.1.2.2 225 mm in the case of continuous rows of seats for two or more passengers.

A.1.7.8.1.3 For vehicles not exceeding a width of 2.35 m:

A.1.7.8.1.3.1 The width of the available space for each seating position, measured from a vertical plane passing through the centre of that seating position at heights between 270 mm and 650 mm above the uncompressed seat cushion, shall be 200 mm (see Annex 2, Figure 9A). In case of compliance with this paragraph the requirements of paragraph A.1.7.8.1.2. above shall not apply; and

A.1.7.8.1.3.2 In the case of vehicles of Class III, the minimum width of the seat cushion, dimension "F" (Annex 4, Figure 9A), measured from a vertical plane passing through the centre of that seating position, shall be a minimum of 200 mm. In case of compliance with this paragraph the requirements of paragraph A.1.7.8.1.1.2 shall not apply.

A.1.7.8.1.4 For vehicles having a capacity not exceeding 22 passengers, in the case of seats adjacent to the wall of the vehicle, the available space does not include, in its upper part, a triangular area 20 mm wide by 100 mm high (see Annex 2, Figure 10). In addition, the space needed for safety belts and their anchorages and for the sun visor should be considered as exempted.

A.1.7.8.1.5 In measuring the gangway width, no account shall be taken of whether or not the available space defined above protrudes into the gangway.

A.1.7.8.2 Minimum depth of seat cushion (dimension K, see Annex 2, Figure 11)

The minimum depth of a seat cushion shall be:

A.1.7.8.2.1 350 mm in vehicles of Class I, A or B, and

A.1.7.8.2.2 400 mm in vehicles of Class II or Class III.

A.1.7.8.3 Height of seat cushion (dimension H, see Annex 2, Figure 11a)

The height of the uncompressed seat cushion relative to the floor shall be such that the distance from the floor to a horizontal plane tangential to the front upper surface of the seat cushion is between 400 mm and 500 mm: this height may however be reduced to not less than 350 mm at the wheel arches (taking into account the allowances permitted in paragraph A.1.7.8.5.2. below) and at the engine/transmission compartment.

A.1.7.8.4 Seat spacing (see Annex 4, Figures 12A and 12B)

A.1.7.8.4.1 In the case of seats facing in the same direction, the distance between the front of a seat squab and the back of the squab of the seat preceding it (dimension H), shall, when

measured horizontally, parallel to the longitudinal plane of the vehicle and at all heights above the floor between the level of the top surface of the seat cushion and a point 620 mm above the floor, not be less than:

<i>H</i>	
Classes I, A and B	650 mm
Classes II and III	680 mm

A.1.7.8.4.2 All measurements shall be taken, with the seat cushion and squab uncompressed using the testing gauge shown in Annex 4, Figure 12B .

A.1.7.8.4.3 Where transverse seats face one another the minimum distance between the front faces of the seat squabs of facing seats, as measured across the highest points of the seat cushions, shall be not less than 1,300 mm.

A.1.7.8.4.4 Measurements shall be taken with reclining passenger seats and adjustable driving seats with their seat backs and other seat adjustments in the normal position of use specified by the manufacturer.

A.1.7.8.4.5 Measurements shall be taken with any folding table fitted to a seat back in the folded (stowed) position.

A.1.7.8.4.6 Seats which are mounted on a track or other system which permits the operator or the user to easily vary the interior configuration of the vehicle shall be measured in the normal position of use specified by the manufacturer in the application for approval.

A.1.7.8.5 Space for seated passengers (see Annex 2, Figure 13)

A.1.7.8.5.1 For a seat behind a partition or other rigid structure other than a seat, a minimum clear space in front of each required passenger seating space (as defined in paragraph A.1.7.8.6) shall be provided as shown in Annex 2, Figure 13. A partition whose contour corresponds approximately to that of the inclined seat back may intrude into this space. In the case of seats alongside the driver's seat in vehicles of Class A or B, intrusion of the dashboard, instrument panel, gear change control, windscreen, sun visor, seat belts and seat belt anchorages shall be allowed.

A.1.7.8.5.2 For a seat behind a seat and/or a seat facing the gangway, a minimum clear foot space of at least 300 mm depth and a width according to paragraph A.1.7.8.1.1 of this annex, shall be provided as shown in Annex 2, Figure 11b. The local presence in this space of seat legs, passenger footrests and of intrusions as provided by paragraph A.1.7.8.6 shall be permitted provided that adequate space remains for the passengers' feet. This foot space may partly be situated in and/or above the gangway but shall not create any obstruction when measuring the minimum gangway-width in accordance with paragraph A.1.7.5 In the case of seats alongside the driver's seat in vehicles of Class A or B, intrusion of the seat belts and seat belt anchorages shall be allowed.

A.1.7.8.5.3 The minimum number of priority seats complying with the requirements of Annex 5, paragraph A.5.3.2 shall be four in Class I, two in Class II and one in Class A. In the case of vehicles of Class III or Class B subject to the requirements of Annex 5, the minimum number of priority seats shall be two in Class III and one in Class B.

A seat that folds out of the way when not in use shall not be designated as a priority seat..

A.1.7.8.6 Free height over seating positions

A.1.7.8.6.1 In the case of single deck vehicles, over each seating position and, except in the case of the seat(s) alongside the driver in a vehicle of Class A or B, its associated foot space, there shall be measured a free space with a height of not less than 900 mm measured from the

highest point of the uncompressed seat cushion and at least 1,350 mm from the mean level of the floor in the foot space. In the case of vehicles to which paragraph A.1.7.1.10 of this annex applies, and also for the seat(s) alongside the driver in a vehicle of Class A or B, these dimensions may be reduced to 1,200 mm measured from the floor and 800 mm measured from the highest point of the uncompressed seat cushion.

In the case of double-deck vehicles, each seating position shall have a free height of not less than 900 mm measured from the highest point of the uncompressed seat cushion. In the case of the upper deck, this free height may be reduced to 850 mm.

A.1.7.8.6.2 This free space shall be extended over the zone defined:

A.1.7.8.6.2.1 By longitudinal vertical planes 200 mm either side of the median vertical plane of the seating position, and

A.1.7.8.6.2.2 By a transverse vertical plane through the rearmost upper point of the seat back and by a transverse vertical plane 280 mm in front of the foremost point of the uncompressed seat cushion, measured in each case at the median vertical plane of the seating position.

A.1.7.8.6.3 From the edges of the free space defined by paragraphs A.1.7.8.6.1 . and A.1.7.8.6.2 , the following zones may be excluded:

A.1.7.8.6.3.1 In the case of the upper part of the outboard seats, adjacent to the inner wall of the vehicle, a zone with a rectangular cross-section 150 mm in height and 100 mm in width (see Annex 4, Figure 14).

A.1.7.8.6.3.2 In the case of the upper part of the outboard seating position, a zone with triangular cross-section whose apex is situated 700 mm from the top and whose base is 100 mm in width (see Annex 2, Figure 15). The space needed for safety belts and their anchorages and for the sun visor is also excluded;

A.1.7.8.6.3.3 In the case of the foot well of an outboard seating position, a zone of a cross-sectional area not exceeding, 0.02 m² (0.03 m² for low floor vehicles) and having a maximum width not exceeding 100 mm (150 mm for low floor vehicles) (see Annex 2, Figure 16).

A.1.7.8.6.3.4 In the case of a vehicle for up to 22 passengers, in the case of the seating places nearest to the rear corners of the body, the outer rear edge of the free space, viewed in plan, may be rounded to a radius not exceeding 150 mm (see Annex 2, Figure 17).

A.1.7.8.6.4 In the free space defined by paragraphs A.1.7.8.6.1 , A.1.7.8.6.2 and A.1.7.8.6.3 , the following additional intrusions shall be permitted:

A.1.7.8.6.4.1 Intrusion of the back of another seat, its supports and its attachments (e.g. folding table);

A.1.7.8.6.4.2 In the case of a vehicle for up to 22 passengers, intrusion of a wheel arch provided that one of the following two conditions is fulfilled:

A.1.7.8.6.4.2.1 The intrusion does not extend beyond the median vertical plane of the seating position (see Annex 2, Figure 18), or

A.1.7.8.6.4.2.2 The nearest edge of the area 300 mm in depth available for the feet of the seated passenger is advanced no more than 200 mm from the edge of the uncompressed seat cushion and to not more than 600 mm in front of the squab of the seat, these measurements being made in the median vertical plane of the seating position (see Annex 2, Figure 19). In the case of two seats facing each other this provision shall apply to only one of the seats and the remaining space for the feet of seated passengers shall be at least 400 mm.

A.1.7.8.6.4.3 In the case of seats alongside the driver's seat in vehicles with up to 22 passengers, intrusion of the dashboard / instrument panel, windscreen, sun visors, seat belts, seat belt anchorages and front dome.

A.1.7.8.6.4.4 Intrusion of hopper type windows when open and their fittings.

A.1.7.9 Communication with the driver

A.1.7.9.1 On vehicles of Classes I, II and A, a means shall be provided to enable passengers to signal that the driver should stop the vehicle. The controls for all such communication devices shall be capable of being operated with the palm of the hand. There shall be appropriate communication devices distributed adequately and evenly throughout the vehicle and no more than 1,500 mm from the floor; this does not exclude the possibility of installing higher additional communication devices. Controls shall contrast visually with their immediate surroundings. Activation of the control shall also be indicated to the passengers by means of one or more illuminated signs. The sign shall display the words "bus stopping" or equivalent, and/or a suitable pictogram and shall remain illuminated until the service door(s) open. Articulated vehicles shall have such signs in each rigid section of the vehicle. Double-deck vehicles shall have them on each deck. The provisions of paragraph A.1.6.11.8 of this annex apply to any textual markings used.

The provisions of paragraph A.1.6.11.4 apply to any textual markings used.

A.1.7.9.2 Communication with the crew compartment

If a crew compartment is fitted without access to the driver or passenger compartments, a means of communication between the driver and this crew compartment shall be provided.

A.1.7.9.3 Communication with the toilet compartment

Toilet compartments shall be fitted with a means of summoning assistance in an emergency.

A.1.7.10 Hot drink machines and cooking equipment

A.1.7.10.1 Hot drink machines and cooking equipment shall be so installed or guarded that no hot food or drink is likely to be spilled on any passenger due to emergency braking or cornering forces.

A.1.7.10.2 On vehicles fitted with hot-drink machines or cooking equipment, all passenger seats shall have adequate provision for setting down hot food or drink whilst the vehicle is in motion.

A.1.7.11 Doors to interior compartments

Every door to a toilet or other interior compartment:

A.1.7.11.1 Shall be self-closing, and shall not be fitted with any device to hold it open if, when open, it could obstruct passengers in an emergency;

A.1.7.11.2 Shall, when open, not conceal any handle, control device for opening or obligatory marking associated with any service door, emergency door, emergency exit, fire extinguisher or first aid kit;

A.1.7.11.3 Shall be provided with a means to enable the door to be opened from outside the compartment in an emergency;

A.1.7.11.4 Shall not be capable of being locked from the outside unless it can always be opened from the inside.

A.1.7.12 Intercommunication staircase of a double-deck vehicle (see Annex 2, Figure 1)

A.1.7.12.1 The minimum width of any intercommunication staircase shall be so designed as to permit the free passage of the single door access template as defined in Figure 1 of Annex 2. The panel shall be moved starting from the gangway of the lower deck up to the last step, in the probable direction of motion of a person using the staircase.

A.1.7.12.2 Intercommunication staircases shall be so designed, that, during heavy braking of the vehicle moving in the forward direction, there is no danger of a passenger being projected downwards.

This requirement is considered to be fulfilled if at least one of the following conditions is met:

A.1.7.12.2.1 No part of the staircase is forward descending;

A.1.7.12.2.2 The staircase is equipped with guards or a similar provision;

A.1.7.12.2.3 There is an automatic device in the upper part of the staircase which prevents the use of the staircase when the vehicle is in motion; this device shall be easily operable in an emergency.

A.1.7.12.3 It shall be verified, by use of the cylinder of paragraph A.1.7.5.1 of this annex, that access conditions from the gangways (upper and lower) to the staircase are adequate.

A.1.7.13 Driver's compartment

A.1.7.13.1 The driver shall be protected from standing passengers and from passengers seated immediately behind the driver's compartment who may be projected into the driver's compartment in the event of braking or cornering. This requirement shall be deemed to be satisfied if:

A.1.7.13.1.1 The rear of the driver's compartment is enclosed by a partition; or

A.1.7.13.1.2 In the case of passenger seats located immediately behind the driver's compartment either a guard or, in the case of a vehicle of Class A or B, a safety-belt is fitted. For vehicles having an area available for standing passengers immediately behind the driver's compartment, the option of fitting a safety-belt shall not apply. Where fitted, a guard shall comply with the requirements specified in paragraphs A.1.7.13.1.2.1 to A.1.7.13.1.2.3 .

(see Annex 2, figure 28).

A.1.7.13.1.2.1 The minimum height of the guard measured from the floor on which the passenger's feet rest shall be 800 mm.

A.1.7.13.1.2.2 The width of the guard shall extend inwards from the wall of the vehicle at least as far as 100 mm beyond the longitudinal centre line of the innermost relevant passenger seat, but in any case shall extend at least as far as the innermost point of the driver's seat.

A.1.7.13.1.2.3 The distance between the uppermost edge of an area destined to hold any object (e.g. a table) and the uppermost edge of a guard shall be at least 90 mm.

A.1.7.13.2 The driver's compartment shall be protected from objects liable to roll into it from the passenger area immediately behind the compartment in the case of heavy braking. This requirement shall be deemed to be satisfied when a ball of 50 mm diameter cannot roll into the driver's compartment from the passenger area immediately behind the compartment.

A.1.7.13.3 The driver shall be protected from the sun and from the effects of glare and reflections caused by artificial interior lighting. Any lighting likely to affect adversely and significantly the driver's vision shall be capable of being operated only while the vehicle is at rest.

A.1.7.13.4 The vehicle shall be provided with devices allowing defrosting and demisting of the windscreen.

A.1.7.14 Driver's seat

A.1.7.14.1 The driver's seat shall be independent of other seats.

A.1.7.14.2 The seat back shall either be curved or the driver's area shall be provided with armrests positioned in such a way that the driver is neither constrained during vehicle manoeuvring operations, nor becomes unbalanced by transverse accelerations which can occur in service.

A.1.7.14.3 The minimum width of the seat cushion, (dimension F, see Annex 2, Figure 9) measured from a vertical plane passing through the centre of the seat, shall be:

A.1.7.14.3.1 200 mm in the case of Class A or B;

A.1.7.14.3.2 225 mm in the case of Class I, II or III.

A.1.7.14.4 The minimum depth of the seat cushion, (dimension K, see Annex 2, Figure 11a) measured from a vertical plane passing through the centre of the seat, shall be:

A.1.7.14.4.1 350 mm in the case of Class A or B;

A.1.7.14.4.2 400 mm in the case of Class I, II or III.

A.1.7.14.5 The minimum overall width of the seat back measured up to a height of 250 mm above the horizontal plane tangential to the uppermost surface of the uncompressed seat cushion shall be 450 mm.

A.1.7.14.6 The distance between armrests shall ensure a free space for the driver, as defined in paragraph A.1.7.14.2, of not less than 450 mm.

A.1.7.14.7 The seat shall be adjustable in its longitudinal and vertical positions and in its seat back inclination. It shall lock automatically in the selected position and, if fitted with a swivelling mechanism, it shall lock automatically when in the driving position. The seat shall be equipped with a suspension system.

A.1.7.14.7.1 The suspension system and the vertical position adjustment are not mandatory for vehicles of Class A or B.

A.1.8 Artificial interior lighting

A.1.8.1 Internal electrical lighting shall be provided for the illumination of:

A.1.8.1.1 All passenger compartments, crew compartments, toilet compartments and the articulated section of an articulated vehicle;

A.1.8.1.2 Any step or steps;

A.1.8.1.3 The access to any exits and the area immediately around the service door(s) including, when in use, any boarding device fitted;

A.1.8.1.4 The internal markings and internal controls of all exits;

A.1.8.1.5 All places where there are obstacles;

A.1.8.1.6 In the case of a double-decked vehicle without a roof, at least one lighting device shall be provided as near as practicable to the top of every staircase leading to the upper deck.

A.1.8.2 There shall be at least two internal lighting circuits such that failure of one will not affect the other. A circuit serving only permanent entry and exit lighting can be considered as one of these circuits.

A.1.8.3 Vehicles of Classes II, III and B shall be equipped with an emergency lighting system:

A.1.8.3.1 It shall be possible for the driver to activate the emergency lighting system from the driver's seating position.

A.1.8.3.2 The operation of the emergency control of any service or emergency door shall activate the emergency lighting system.

A.1.8.3.3 The emergency lighting system, once activated, shall remain active for at least 30 minutes unless de-activated by the driver.

A.1.8.3.4 The power supply for the emergency lighting shall be suitably located within the vehicle to minimise the risk of its continued operation being prejudiced as the result of an accident.

A.1.8.3.5 All units providing the emergency lighting shall produce a white light.

A.1.8.3.6 The uniformity of illuminance of the lighting shall be assessed in accordance with the following measures:

$$\text{Maximum uniformity of illuminance} = \frac{\text{Maximum lighting level recorded}}{\text{Average lighting level recorded}}$$

$$\text{Minimum uniformity of illuminance} = \frac{\text{Minimum lighting level recorded}}{\text{Average lighting level recorded}}$$

A.1.8.3.7 The emergency lighting system shall provide a minimum illuminance of 10 lux directly under each light unit in the passenger compartment at a height of 750 mm above the centreline of all access passages and gangways.

A.1.8.3.8 The uniformity of the illuminance over the length of the passenger compartment at a height of 750 mm above all access passages and gangways shall be between 0.15 and 2.

A.1.8.3.9 The emergency lighting system shall provide a minimum illuminance of 1 lux at floor level in the centreline of all access passages and gangways and at the centre of any step, at step level.

A.1.8.3.10 Conformity with the uniformity requirements shall be demonstrated over a period of at least 30 minutes from initiation of the emergency lighting by measurements taken at distances not exceeding 2 metres.

A.1.8.4 Individual lights for each of the items in paragraph A.1.8.1 are not required providing adequate illumination can be maintained during normal use.

A.1.8.5 Control of the mandatory interior lighting shall be by manual switches under the control of the driver or automatically controlled.

A.1.9 Articulated section of articulated vehicles

A.1.9.1 The articulated section that interconnects rigid portions of the vehicle shall be so designed and constructed as to allow at least one rotary movement about at least one horizontal axis, and at least one vertical axis.

A.1.9.2 When the articulated vehicle at its mass in running order is stationary on a horizontal level surface, there shall not be between the floor of either of the rigid sections and the floor of the rotating base or of the element replacing that base an uncovered gap of a width exceeding:

A.1.9.2.1 10 mm when all the wheels of the vehicle are on the same plane, or

A.1.9.2.2 20 mm when the wheels of the axle adjacent to the articulated section are resting on a surface which is 150 mm higher than the surface on which the wheels of the other axles are resting.

A.1.9.3 The difference in level between the floor of the rigid portions and the floor of the rotating base, measured at the joint, shall not exceed:

A.1.9.3.1 20 mm in the conditions described in paragraph A.1.9.2.1, or

A.1.9.3.2 30 mm in the conditions described in paragraph A.1.9.2.2.

A.1.9.4 On articulated vehicles means shall be provided to physically prevent access by passengers to any part of the articulated section where:

A.1.9.4.1 The floor has an uncovered gap not complying with the requirements of paragraph A.1.9.2.;

A.1.9.4.2 The floor cannot carry the mass of the passengers;

A.1.9.4.3 The movements of the walls constitute a danger to passengers.

A.1.10 Direction-holding of articulated vehicles

When an articulated vehicle is moving in a straight line, the longitudinal median planes of its rigid portion shall coincide and form a continuous plane without any deflection.

A.1.11 Handrails and handholds

A.1.11 General requirements

A.1.11.1 Handrails and handholds shall be of adequate strength.

A.1.11.1.2 They shall be so designed and installed as to present no risk of injury to passengers.

A.1.11.1.3 Handrails and handholds shall be of a section enabling passengers to grasp them easily and firmly. Every handrail shall provide a length of at least 100 mm to accommodate a

hand. No dimension of the section shall be smaller than 20 mm or greater than 45 mm except in the case of handrails on doors and seats and, in the case of a vehicle of Class II, III or B, in access passages. In these cases handrails having a minimum dimension of 15 mm shall be permitted provided that one other dimension is of at least 25 mm. Handrails shall not have sharp bends.

A.1.11.1.4 The clearance between a hand-rail or hand-hold, along the majority of its length, and the adjacent part of the vehicle body or walls shall be at least 40 mm. However, in the case of a handrail on a door or a seat, or in the access passage of a vehicle of Class II, III or B, a minimum clearance of 35 mm shall be permitted.

A.1.11.1.5 The surface of every handrail, handhold or stanchion shall contrast visually with their immediate surroundings and be slip-resistant.

A.1.11.2 Additional requirements for handrails and handholds for vehicles designed to carry standing passengers

A.1.11.2.1 Handrails and/or handholds shall be provided in sufficient number for each point of the floor area intended, in conformity with paragraph A.1.2.2. of this annex for standing passengers. For this purpose, strap hangers, if fitted, may be counted as handholds, provided that they are held in their position by suitable means. This requirement shall be deemed to be fulfilled if, for all possible sites of the testing device shown in Annex 2, Figure 20 hereto, at least two handrails or handholds can be reached by the device's moveable arm. The testing device may be freely turned about its vertical axis.

A.1.11.2.2 When applying the procedure described in paragraph A.1.11.2.1, only such handrails and handholds shall be considered which are not less than 800 mm and not more than 1,950 mm above the floor.

A.1.11.2.3 For every position that can be occupied by a standing passenger, at least one of the two required handrails or handholds shall be not more than 1,500 mm above the level of the floor at that position. This does not apply to an area adjacent to a door where the door or its mechanism in open position would prevent the use of this handhold. Also, exception may be given in the middle of large platforms, but the sum of these exceptions shall not exceed 20 per cent of the total standing area.

A.1.11.2.4 Areas which can be occupied by standing passengers and are not separated by seats from the side walls or rear wall of the vehicle shall be provided with horizontal handrails parallel to the walls and installed at a height of between 800 mm and 1,500 mm above the floor.

A.1.11.3 Handrails and handholds for service doors

A.1.11.3.1 Door apertures shall be fitted with handrails and/or handholds on each side. In the case of double doors this requirement can be fulfilled by fitting one central stanchion or one central handrail.

A.1.11.3.2 Handrails and/or handholds to be provided for service doors shall be such that they include a grasping point available to a person standing on the ground adjacent to the service door or on any of the successive steps. Such points shall be situated, vertically, between 800 mm and 1,100 mm above the ground or above the surface of each step, and horizontally:

A.1.11.3.2.1 For the position appropriate to a person standing on the ground, not more than 400 mm inwards from the outer edge of the first step; and

A.1.11.3.2.2 For the position appropriate to a particular step, not outwards from the outer edge of the step considered, and not more than 600 mm inwards from that same edge.

A.1.11.4 Handrails and handholds for intercommunication staircases in double-deck vehicles.

A.1.11.4.1 Suitable handrails or handholds shall be provided at each side of all intercommunication staircases. These shall be positioned between 800 mm and 1,100 mm above the tread edge of each step.

A.1.11.4.2 The handrails and/or handholds to be provided shall be such that they include a grasping point available to a person standing on the lower or upper deck adjacent to the intercommunication staircase, and at any of the successive steps. Such points shall be situated vertically between 800 mm and 1,100 mm above the lower deck or each above the surface of each step, and,

A.1.11.4.2.1 For the position appropriate to a person standing on the lower deck, not more than 400 mm inwards from the outer edge of the first step, and

A.1.11.4.2.2 For the position appropriate to a particular step, not outwards from the outer edge of the step considered, and not more than 600 mm inwards from the same edge.

A.1.12 Guarding of step wells and exposed seats

A.1.12.1 Where any seated passenger is likely to be thrown forward into a step well, designated wheelchair space, pram space or open area for standing passengers as a result of heavy braking, either a guard or, in the case of a vehicle of Class A or B, a safety-belt shall be fitted. Where fitted, the guard shall have a minimum height from the floor on which the passenger's feet rest of 800 mm and shall extend inwards from the wall of the vehicle at least as far as 100 mm beyond the longitudinal centre line of any seating position where the passenger is at risk or, in the case of a step well, to the riser of the innermost step; whichever is the lesser."

A.1.12.2 Paragraph A.1.12.1. shall not apply to any sideways facing seat, a seat which has its centreline within the longitudinal projection of a gangway, a seat in front of which is existing vehicle structure (e.g. fixed table or luggage pen) offering comparable levels of protection as a guard meeting the requirements of paragraph A.1.12.1. or transverse facing seats where the maximum distance between the front faces of the seat squabs of facing seats does not exceed 1,800 mm when measured in accordance with paragraph A.1.7.8.4.3

A.1.12.3 On the upper deck of a double-deck vehicle, the intercommunication staircase well shall be protected by an enclosed guard having a minimum height of 800 mm measured from the floor. The lower edge of the guard shall not be more than 100 mm from the floor.

A.1.12.4 The front windscreen ahead of passengers occupying upper deck front seats of a double-deck vehicle shall be provided with a padded guard. The higher edge of that protection shall be situated vertically between 800 mm and 900 mm above the floor where the passenger's feet rest.

A.1.12.5 The riser of each step in an intercommunication staircase of a double-deck vehicle shall be closed.

A.1.13 Baggage racks and occupant protection

The occupants of the vehicle shall be protected from objects liable to fall from baggage racks under braking or cornering forces. If baggage compartments are fitted, they shall be designed in such a way that baggage is prevented from falling in the event of sudden braking.

A.1.14 Trap doors, if fitted

A.1.14.1 Every trap door, that is not an escape hatch, on the floor of a vehicle shall be so fitted and secured that it cannot be dislodged or opened without the use of tools or keys and no lifting or securing device shall project by more than eight mm above floor level. Edges of projections shall be rounded.

A.1.15 Visual entertainment

A.1.15.1 Forms of visual entertainment for passengers, for example television monitors or videos shall be located out of the driver's view when the driver is seated in his normal driving position. This shall not preclude any television monitor or similar device used as part of the driver's control or guidance of the vehicle, for example to monitor service doors.

A.1.16 Trolleybuses

A.1.16.1 Trolleybuses shall meet the provisions of Annex 7.

A.1.17 Passenger protection in vehicles without a roof

Every vehicle without a roof shall have:

A.1.17.1 A continuous front panel over the full width of that part of the vehicle that does not have a roof, with a height of not less than 1,400 mm from the general level of the floor adjacent to the front panel;

A.1.17.2 A continuous protection around the side and rear of that part of the vehicle that does not have a roof, with a height of not less than 1,100 mm at the sides and 1,200 mm at the rear of the vehicle, measured from the general level of the floor adjacent to the panels. The protection shall consist of continuous side and rear panels with a height of not less than 700 mm from the general level of the floor adjacent to the panels, combined with one or more continuous guard rail(s) that fulfils the following characteristics:

- (a) No dimension of its section shall be less than 20 mm, or more than 45 mm;
- (b) The size of any aperture between a guard rail and any adjacent guard rail or panel shall not exceed 200 mm;
- (c) It shall be firmly attached to the structure of the vehicle;
- (d) Doors at exits shall be considered to form part of this protection.

A.1.18 Vision and communication aid

In the case of a vehicle without a roof, the driver shall be provided with a visual means, such as a mirror, periscope or video camera/monitor, to enable the behaviour of passengers in the area without a roof to be observed. In addition, an intercommunication system shall be provided to enable the driver to communicate with these passengers.

Annex 2 -**Verification of static tilting limit by means of calculation**

A.2.1 A vehicle may be shown to meet the requirement specified in paragraph A.1.4. of Annex 1 by a calculation method approved by the Technical Service for conducting the tests.

A.2.2 The Technical Service responsible for conducting the tests may require tests to be carried out on parts of the vehicle to verify the assumptions made in the calculation.

A.2.3 Preparations for calculation

A.2.3.1 The vehicle shall be represented by a spatial system.

A.2.3.2 Due to the location of the centre of gravity of the body of the vehicle and the different spring rates of the vehicle suspension and tyres, axles do not generally lift simultaneously on one side of the vehicle as a result of lateral acceleration. Therefore, lateral tilting of the body over each axle has to be ascertained on the supposition that the wheels of the other axle(s) remain on the ground.

A.2.3.3 To simplify matters, it shall be assumed that the centre of gravity of the unsprung masses lies in the longitudinal plane of the vehicle on the line passing through the centre of the wheel rotation axle. The small shifting of the roll centre due to deflection of the axle can be neglected. The air suspension control should not be taken into account.

A.2.3.4 The following parameters, at least, shall be taken into account:

Vehicle data such as wheel base tread width and sprung/unsprung masses, location of the centre of gravity of the vehicle, deflection and rebound and the spring rate of the vehicle suspension, considering also non-linearity, horizontal and vertical spring rate of the tyres, torsion of the superstructure and location of the roll centre of the axles.

A.2.4 Validity of the calculation method

A.2.4.1 The validity of the calculation method shall be established to the satisfaction of the Technical Service, e.g. on the basis of a comparative test with a similar vehicle.

	UD	450	300 ³	500	1,680	900

The height of the upper cylinder and herewith the overall height may be reduced by 100 mm in any part of the gangway to the rear of:

(a) A transverse plane situated 1.5 m forward of the centre line of the rear axle (foremost rear axle in the case of vehicles with more than one rear axle), and

(b) A transverse vertical plane situated at the rear edge of the service door or of the rearmost service door if there are more than one service door.

² The diameter of the lower cylinder may be reduced from 450 mm to 400 mm in any part of the gangway to the rear of the most forward of the following two planes:

(a) A transverse vertical plane situated 1.5 m forward of the centre line of the rear axle (foremost rear axle in the case of vehicles with more than one rear axle); and

(b) A transverse vertical plane situated at the rear edge of the rearmost service door in between the axles.

For the purpose of the above, each rigid section of an articulated vehicle shall be considered separately.

³ 220 mm in the case of laterally movable seats (see paragraph .A.1.7.5.3 of Annex 1).

⁴ In the case of a vehicle with part of its deck directly over the driver's compartment, the overall height of the gauging device may be reduced (by reducing the height of the lower cylinder) from 1,900 mm to 1,680 mm in any part of the gangway forward to a transverse vertical plane which coincides with the centre line of the front axle.

⁵ The overall height of the gauging device may be reduced (by reducing the height of the lower cylinder):

(a) From 1,800 mm to 1,680 mm in any part of the gangway of the lower deck to the rear of a transverse vertical plane situated 1,500 mm forward to the centre of the rear axle (foremost rear axle in the case of vehicles with more than one rear axle);

(b) From 1,800 mm to 1,770 mm in the case of a service door which is situated forward the front axle in any part of the gangway situated between two transverse vertical planes situated 800 mm forwards and behind the centre line of the front axle.

Annex 3**Guidelines for measuring the closing forces of power-operated doors**

(See Annex 1, paragraph A.1.6.5.6.1.1)

And the reactive forces of power-operated ramps

(See Annex 5, paragraph A.5.3.11.4.3.3)

A.3.1 General

The closing of a power-operated door and the operation of a power-operated ramp are dynamic processes. When a moving door or ramp hits an obstacle, the result is a dynamic reaction force, the history of which (in time) depends on several factors (for example, mass of the door or ramp, acceleration, dimensions).

A.3.2 Definitions

A.3.2.1 Closing or reactive force $F(t)$ is a time function, measured at the outer edge of the door or ramp (see A.3.3.2 below).

A.3.2.2 Peak force F_S is the maximum value of the closing or reactive force.

A.3.2.3 Effective force F_E is the average value of the closing or reactive force related to the pulse duration:

$$F_E = \frac{1}{T} \int_{t_1}^{t_2} F(t) dt$$

A.3.2.4 Pulse duration T is the time between the t_1 and t_2 :

$$T = t_2 - t_1$$

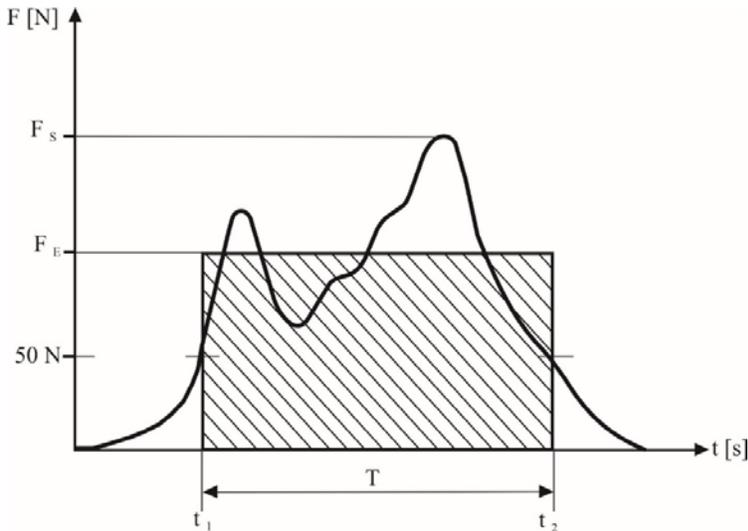

Where,

t_1 = threshold of sensitivity, where the closing or reactive force exceeds 50 N;

t_2 = fade-away threshold, where the closing or reactive force becomes less than 50 N.

A.3.2.5 The relation between the above parameters is shown in Figure 1 below (as an example):

Figure 1

A.3.2.6 Clamping or mean reactive force F_C is the arithmetical mean value of the effective forces, measured at the same measuring point subsequently more times:

$$F_C = \frac{\sum_{i=1}^{i=n} (F_E)_i}{n}$$

A.3.3 Measurements

A.3.3.1 Conditions of measurement:

A.3.3.1.1 Temperature range: 10 °C to 30 °C

A.3.3.1.2 The vehicle shall be standing on a horizontal surface. In the case of ramp measurements, this surface shall be fitted with a rigidly mounted block or other similar device having a face against which the ramp can react.

A.3.3.2 Measurement points shall be:

A.3.3.2.1 In the case of doors:

A.3.3.2.1.1 At the main closing edges of the door:

One in the middle of the door;

One 150 mm above the lower edge of the door.

A.3.3.2.1.2 If equipped with clamping prevention devices for the opening process:

At the secondary closing edges of the door at that point which is considered to be the most dangerous place of clamping.

A.3.3.2.2 In the case of ramps:

A.3.3.2.2.1 At the outer edge of the ramp situated perpendicularly to its direction of movement:

One in the middle of the ramp;

One 100 mm inboard from each of the edges parallel to the direction of travel of the ramp.

A.3.3.3 At least three measurements shall be taken at each of the measuring points to determine the clamping or mean reactive force according to paragraph 2.6. above.

A.3.3.4 The signal of the closing or reactive force shall be recorded by means of a low-pass filter with a limiting frequency of 100 Hz. Both the threshold of sensitivity and the fade-away threshold to limit the pulse duration shall be set at 50 N.

A.3.3.5 The deviation of the reading from the rated value shall not be more than ± 3 per cent.

A.3.4 Measuring device

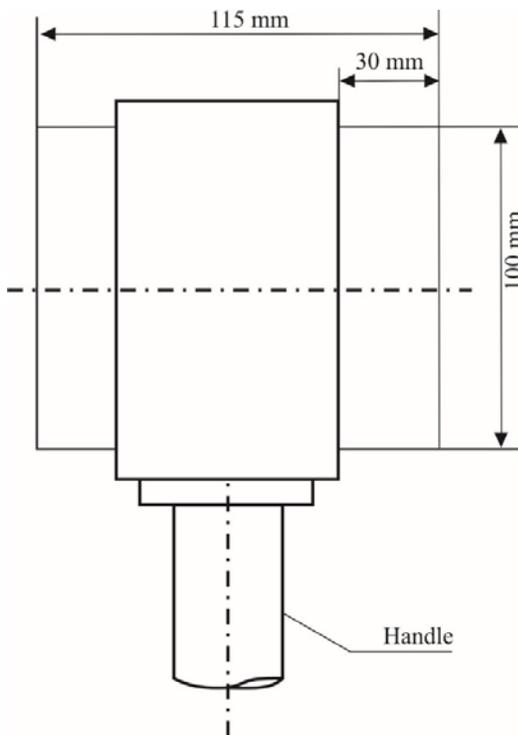

A.3.4.1 The measuring device shall consist of two parts: one handle and one measuring part which is a load cell (see Figure 2).

A.3.4.2 The load cell shall have the following characteristics:

A.3.4.2.1 It shall consist of two sliding housings with the outer dimension of 100 mm in diameter and 115 mm in width. Inside the load cell a compression spring shall be fitted between the two housings such that the load cell can be pressed together if an appropriate force is applied.

A.3.4.2.2 The stiffness of the load cell shall be 10 ± 0.2 N/mm. The maximum spring deflection shall be limited to 30 mm so that a maximum peak force of 300 N is achieved.

Figure 2

Annex 4

Alternative requirements for vehicles of Classes A and B

A.4.1 Vehicles of Classes A and B shall comply with the requirements of Annex 1 with the exception that:

- (a) In place of paragraph A.1.7.6.3.1 of Annex 1, a vehicle may comply with paragraph A.4.1.1 of this annex;
- (b) In place of paragraph A.1.7.6.2 of Annex 1, a vehicle may comply with paragraph A.4.1.2 of this annex.

A.4.1.1 Minimum dimensions for exits

The several kinds of exits shall have the following minimum dimensions:

<i>Aperture</i>	<i>Minimum dimensions</i>	<i>Remarks</i>
Service Door	<i>Entry height:</i> Class A 1,650 mm B 1,500 mm	The service door entry height shall be measured as the vertical distance measured on a vertical plane of the horizontal projections of the mid-point of the door aperture and the top surface of the lowest step.
	<i>Aperture Height</i>	The vertical height of the service door aperture shall be such as to permit the free passage of the dual panel referred to in paragraph 7.7.1.1. of Annex 3. The upper corners may be reduced with round-offs, with a radius of not more than 150 mm.
	<i>Width:</i> Single door: 650 mm Double door: 1,200 mm	For Class B vehicles where the service door aperture height lies between 1,400 mm and 1,500 mm a minimum single door aperture width of 750 mm shall apply. For all the vehicles the width of any service door may be reduced by 100 mm when the measurement is made at the level of the handholds and by 250 mm in cases where intruding wheel arches or the actuating mechanism for automatic or remote-control doors or the rake of the windscreen so require.

<i>Aperture</i>	<i>Minimum dimensions</i>	<i>Remarks</i>
Emergency door	Height: 1,250 mm Width: 550 mm	The width may be reduced to 300 mm in cases where intruding wheel arches so require, providing that the width of 550 mm is respected at the minimum height of 400 mm above the lowest part of the door aperture. The upper corners may be reduced with round-offs, with a radius of not more than 150 mm.
Emergency Window	Aperture area: 400,000 mm ²	It shall be possible to inscribe in this area a rectangle of 500 mm x 700 mm.
Escape hatch	Aperture area: 450,000 mm ²	It shall be possible to inscribe in this area a rectangle of 600 mm x 700 mm.

A.4.1.1.1 A vehicle to which paragraph A.1.7.1.10 of Annex 1 applies shall meet the requirements of paragraph A.1.6.3.1 of Annex 1 or paragraph A.4.1.1 of this annex as regards emergency windows and escape hatches, and the following minimum requirements as regards service doors and emergency doors:

<i>Aperture</i>	<i>Dimensions</i>	<i>Remarks</i>
Service Door	Aperture height: 1,100 mm	This dimension may be reduced by a radius at the corners of the aperture not exceeding 150 mm.
	Width: Single door: 650 mm Double door: 1,200 mm	This dimension may be reduced by a radius at the corners of the aperture not exceeding 150 mm. The width may be reduced by 100 mm when the measurement is made at the level of the handholds and by 250 mm in cases where intruding wheel arches or the actuating mechanism for automatic or remote-control doors or the rake of the windscreen so require.
Emergency door	Height: 1,100 mm Width: 550 mm	The width may be reduced to 300 mm in cases where intruding wheel arches so require, providing that the width of 550 mm is respected at the minimum height of 400 mm above the lowest part of the door aperture. The upper corners may be reduced

<i>Aperture</i>	<i>Dimensions</i>	<i>Remarks</i>
		with round-offs with a radius of not more than 150 mm.

Annex 5

Accommodation and accessibility for passengers with reduced mobility

A.5.1 General

This annex contains the provisions which apply to a vehicle designed for easy access for passengers with reduced mobility and wheelchair users.

A.5.2 Scope

These requirements shall apply to vehicles permitting easier access for persons with reduced mobility.

A.5.3 Requirements

A.5.3.1 Steps

The height of steps in an access passage at the above-mentioned door(s), and throughout the entire gangway, shall be not more 250 mm for vehicles of Class I and A and 320 mm for vehicles of Classes II, III and B. In the case where only one service door meets this requirement there shall be no barrier or sign which prevents that door from being used as both an entrance and an exit.

As an alternative for vehicles of Classes I and A, the first step from the ground shall not exceed 270 mm in two door openings, one entrance and one exit.

In low floor vehicles only a kneeling system, but not a retractable step, may be engaged.

In other vehicles either a kneeling system and/or a retractable step may be engaged.

The height of steps in an access passage at the above-mentioned door(s), and in the gangway, shall be not more than 200 mm for vehicles of Classes I and A and 250 mm for vehicles of Classes II, III and B.

The transition from a sunken gangway to a seating area shall not be considered to be a step.

A.5.3.2 Priority seats and space for passengers with reduced mobility

A.5.3.2.1 Seats shall be either forward or rearward facing and shall be situated in a position near to a service door(s) suitable for boarding and alighting and compliant with paragraph A.5.3.1 .

A.5.3.2.2 There shall be adequate space for a guide dog under, or adjacent to, at least one of the priority seats. This space shall not form a part of the gangway.

A.5.3.2.3 Armrests shall be fitted on seats between the seating position and the gangway and shall be capable of being moved easily out of the way to permit clear access to the seat. In the case of seats facing each other one of the gangway seats may alternatively be fitted with a vertical stanchion. This stanchion shall be positioned so that the seat occupant is kept securely on the seat and easy access to the seat is possible.

A.5.3.2.4 The minimum width of a priority seat cushion, measured from a vertical plane passing through the centre of that seating position, shall be 220 mm on each side.

A.5.3.2.5 The height of the uncompressed seat cushion relative to the floor shall be such that the distance from the floor to a horizontal plane tangent to the front upper surface of the seat cushion is between 400 mm and 500 mm.

A.5.3.2.6 The foot space at priority seating positions shall extend forward of the seat from a vertical plane through the forward edge of the seat cushion. The foot space shall not have a slope in any direction of more than 8 per cent. For vehicles of Classes I and A, the vertical distance between the floor of the seating area and the adjacent gangway shall be not more than 250 mm.

A.5.3.2.7 Each priority seating position shall have a free height of not less than 1,300 mm for vehicles of Classes I and A and 900 mm for vehicles of Class II, measured from the highest point of the uncompressed seat cushion. This free height shall extend over the vertical projection of the minimum required seat width of 440 mm and the associated foot space.

Intrusion of a seat back or other object into this space shall be permitted provided that a minimum clear vertical space extending 230 mm in front of the seat cushion is maintained. Where the priority seat is positioned facing a bulkhead more than 1,200 mm in height this space shall be 300 mm. From the edges of the free space defined above, intrusions are permitted in accordance with paragraphs A.1.7.8.6.3.1 to A.1.7.8.6.3.4 of Annex 1 as if reference to the clear space in paragraphs A.1.7.8.6.1 and A.1.7.8.6.2 of Annex 1 is a reference to the clear space defined above. The provisions of paragraph A.1.7.8.1.4 of Annex 1 may apply. Intrusions of handholds or handrails as mentioned in paragraph A.5.3.4.2 may protrude by a maximum of 100 mm from the sidewall into the clear space over the vertical projection of the foot space.

A.5.3.2.8 Vehicles fitted with a priority seat shall have pictogram(s) in accordance with Annex 2, Figure 23B visible from the outside, both on the front nearside of the vehicle and adjacent to the relevant service door(s). A pictogram shall be placed internally adjacent to the priority seat.

A.5.3.3 Communication devices

A.5.3.3.1 Communication devices shall be placed adjacent to any priority seat and within any wheelchair area and shall be at a height between 700 mm and 1,200 mm above the floor.

A.5.3.3.2 Communication devices situated in the low floor area shall be at a height between 800 mm and 1,500 mm where there are no seats.

A.5.3.3.4 If a vehicle is fitted with a ramp or lift, a means of communication with the driver shall be fitted outside, adjacent to the door, and at a height between 850 mm and 1,300 mm from the ground. This requirement shall not apply to a door situated in the direct field of vision of the driver.

A.5.3.4 Handrails to priority seating

A.5.3.4.1 A handrail at a height of between 800 mm and 900 mm above the floor level shall be provided between the priority seats as described in paragraph A.1.7.8.5.3 of Annex 1 and at least one service door suitable for boarding and alighting. A break is permitted where it is necessary to gain access to a wheelchair space, a seat located at a wheel arch, a staircase, an access passage or a gangway. Any break in the handrail shall not exceed 1,050 mm and a vertical handrail shall be provided on at least one side of the break.

A.5.3.4.2 Handrails or handholds shall be placed adjacent to priority seating positions to facilitate entry and exit of the seat, and shall be designed in such a way as to allow the passenger to grasp them easily.

A.5.3.5 Floor slope

The slope of any gangway, access passage or floor area between any priority seat or wheelchair space and at least one entrance and one exit or a combined entrance and exit shall not exceed 8 per cent. Such sloping areas shall be provided with a slip-resistant surface.

A.5.3.6 Wheelchair accommodation provisions

A.5.3.6.1 For each wheelchair user provided for in the passenger compartment there shall be a special area at least 750 mm wide and 1,300 mm long. The longitudinal plane of the special area shall be parallel to the longitudinal plane of the vehicle and the floor surface of the special area shall be slip resistant and the maximum slope in any direction shall not exceed 5 per cent. In the case of a rearward facing wheelchair complying with the requirements specified in paragraph A.5.3.8.4 of this annex, the slope in the longitudinal direction shall not exceed 8 per cent provided that this slope inclines upwards from the front end to the rear end of the special area.

In the case of a wheelchair space designed for a forward facing wheelchair, the top of preceding seat-backs may intrude into the wheelchair space if a clear space is provided as shown in Annex 2, Figure 22.

A.5.3.6.2 There shall be at least one doorway through which wheelchair users can pass. In the case of vehicles of Class I, at least one wheelchair access door shall be a service door. The wheelchair access door shall bear a boarding device complying with the provisions of paragraph A.5.3.11.3 (a lift) or A.5.3.11.4 (a ramp) of this annex.

A.5.3.6.3 A door for wheelchair access, that is not a service door, shall have a minimum height of 1,400 mm. The minimum width of all doors providing wheelchair access to the vehicle shall be 900 mm which may be reduced by 100 mm when the measurement is made at the level of handholds.

A.5.3.6.4 It shall be possible for a wheelchair user to move freely and easily from the outside of the vehicle through at least one of the doors for wheelchair access into the special area(s) with the reference wheelchair, the dimensions of which are shown in Annex 2, Figure 21.

A.5.3.6.4.1 By "*moving freely and easily*", it is meant that there exists:

- (a) Sufficient space available for the wheelchair user to manoeuvre without the assistance of a person;
- (b) There are no steps, gaps or stanchions which could be an obstacle to the free movement of the wheelchair user.

A.5.3.6.4.2 For the application of the above provisions, the test shall be performed, in the case of vehicles of Classes I and A fitted with more than one wheelchair space, for each wheelchair space with all other wheelchair spaces occupied by the reference wheelchair.

A.5.3.6.5 In vehicles of Classes I and A fitted with a ramp for wheelchair access, it shall be possible for a reference wheelchair having the dimensions shown in Annex 2, Figure 21 to enter and exit a vehicle with the wheelchair moving in a forward direction.

A.5.3.6.6 Vehicles fitted with a wheelchair space shall have pictogram(s) in accordance with Annex 2, Figure 23A visible from the outside, both on the front nearside of the vehicle and adjacent to the relevant service door(s).

One of these pictograms shall be placed internally adjacent to each wheelchair space indicating whether the wheelchair is to be positioned facing the front or the rear of the vehicle.

A.5.3.7 Seats and standing passengers in the wheelchair space

A.5.3.7.1 Folding seats may be fitted in a wheelchair space. However, such seats when folded and out of use shall not intrude into the wheelchair space.

A.5.3.7.2 A vehicle may be equipped with demountable seats fitted in the wheelchair space provided that such seats may be easily removed by the driver or a crew member.

A.5.3.7.3 For vehicles of Classes I, II and A, where the foot space of any seat, or part of a folding seat when in use, intrudes into a wheelchair space, those seats shall have signs fixed on or adjacent to them with the following text, equivalent text or pictogram:

"Please give up this space for a wheelchair user".

The provisions of paragraph A.1.6.11.8 of Annex 1 apply to any textual markings used.

A.5.3.7.4 In vehicles where any wheelchair space is designated for use exclusively by a wheelchair user as provided for in paragraph A.1.2.2.2.10 of Annex 1, those spaces shall be clearly marked with the following text, equivalent text or pictogram:

"Area designated for use exclusively by a wheelchair user"

The provisions of paragraph A.1.6.11.8 of Annex 1 apply to any textual markings used.

A.5.3.8 Stability of wheelchairs

A.5.3.8.1 In vehicles required to have occupant restraint systems fitted, the wheelchair space shall be designed for the wheelchair user to travel facing forwards and shall be fitted with restraint

systems complying with either the requirements specified in paragraph A.5.3.8.2 or those specified in paragraph A.5.3.8.3 .

In vehicles not required to have occupant restraint systems fitted, the wheelchair space shall be fitted with restraint systems complying with the requirements specified in paragraph A.5.3.8.2 or A.5.3.8.3 , or shall comply with the requirements specified in paragraph A.5.3.8.4 .

A.5.3.8.2 Forward-facing wheelchair - static test requirements

A.5.3.8.2.1 Each wheelchair space shall be provided with a restraint system capable of restraining the wheelchair and the wheelchair user.

A.5.3.8.2.2 This restraint system and its anchorages shall be designed to withstand forces equivalent to the ones required for the passenger seats and occupant restraint systems.

A.5.3.8.2.3 A static test shall be carried out in accordance with the following requirements:

A.5.3.8.2.3.1 The forces referred hereto shall be applied in forward and rearward directions, separately and on the restraint system itself;

A.5.3.8.2.3.2 The force shall be maintained for a period of not less than 0.2 seconds;

A.5.3.8.2.3.3 The restraint system shall be capable of withstanding the test. Permanent deformation, including partial rupture or breakage of the restraint system shall not constitute failure if the required force is sustained for the specified time. Where applicable, the locking device enabling the wheelchair to leave the vehicle shall be operable by hand after removal of the traction force.

A.5.3.8.2.4 In forward direction in the case of a separate wheelchair and wheelchair user restraint system

A.5.3.8.2.4.1 For category M₂:

A.5.3.8.2.4.1.1 $1,110 \pm 20$ daN in the case of a lap belt. The force shall be applied on the wheelchair user restraint system in the horizontal plane of the vehicle and towards the front of the vehicle if the restraint system is not attached to the floor of the vehicle. If the restraint system is attached to the floor, the force shall be applied in an angle of 45 ± 10 degrees to the horizontal plane of the vehicle and towards the front of the vehicle;

A.5.3.8.2.4.1.2 675 ± 20 daN in the horizontal plane of the vehicle and towards the front of the vehicle on the lap portion of the belt and 675 ± 20 daN in the horizontal plane of the vehicle and towards the front of the vehicle on the torso portion of the belt in the case of 3-point belt;

A.5.3.8.2.4.1.3 $1,715 \pm 20$ daN in an angle of 45 ± 10 degrees to the horizontal plane of the vehicle and towards the front of the vehicle on the wheelchair restraint system;

A.5.3.8.2.4.1.4 The forces shall be applied simultaneously;

A.5.3.8.2.4.2 For category M₃:

A.5.3.8.2.4.2.1 740 ± 20 daN in the case of a lap belt. The force shall be applied on the wheelchair user restraint system in the horizontal plane of the vehicle and towards the front of the vehicle if the restraint system is not attached to the floor of the vehicle. If the restraint system is attached to the floor, the force shall be applied in an angle 45 ± 10 degrees to the horizontal plane of the vehicle and towards the front of the vehicle;

A.5.3.8.2.4.2.2 450 ± 20 daN in the horizontal plane of the vehicle and towards the front of the vehicle on the lap portion of the belt and 450 ± 20 daN in the horizontal plane of the vehicle and towards the front of the vehicle on the torso portion of the belt in the case of 3-point belt;

A.5.3.8.2.4.2.3 $1,130 \pm 20$ daN in an angle of 45 ± 10 degrees to the horizontal plane of the vehicle and towards the front of the vehicle on the wheelchair restraint system;

A.5.3.8.2.4.2.4 The forces shall be applied simultaneously.

A.5.3.8.2.5 In forward direction in the case of a combined wheelchair and wheelchair user restraint system.

A.5.3.8.2.5.1 For category M₂;

A.5.3.8.2.5.1.1 1,110 ± 20 daN in an angle of 45 ± 10 degrees to the horizontal plane of the vehicle and towards the front of the vehicle on the wheelchair user restraint system in the case of a lap belt;

A.5.3.8.2.5.1.2 675 ± 20 daN in an angle of 45 ± 10 degrees to the horizontal plane of the vehicle and towards the front of the vehicle on the lap portion of the belt and 675 ± 20 daN in the horizontal plane of the vehicle and towards the front of the vehicle on the torso portion of the belt in the case of 3-point belt;

A.5.3.8.2.5.1.3 1,715 ± 20 daN in an angle of 45 ± 10 degrees to the horizontal plane of the vehicle and towards the front of the vehicle on the wheelchair restraint system;

A.5.3.8.2.5.1.4 The forces shall be applied simultaneously.

A.5.3.8.2.5.2 For category M₃:

A.5.3.8.2.5.2.1 740 ± 20 daN in an angle of 45 ± 10 degrees to the horizontal plane of the vehicle and towards the front of the vehicle on the wheelchair user restraint system in the case of a lap belt;

A.5.3.8.2.5.2.2 450 ± 20 daN in an angle of 45 ± 10 degrees to the horizontal plane of the vehicle and towards the front of the vehicle on the lap portion of the belt and 450 ± 20 daN in the horizontal plane of the vehicle and towards the front of the vehicle on the torso portion of the belt in the case of 3-point belt;

A.5.3.8.2.5.2.3 1,130 ± 20 daN in an angle of 45 ± 10 degrees to the horizontal plane of the vehicle and towards the front of the vehicle on the wheelchair restraint system;

A.5.3.8.2.5.2.4 The forces shall be applied simultaneously.

A.5.3.8.2.6 In rearward direction:

A.5.3.8.2.6.1 810 ± 20 daN in an angle of 45 ± 10 degrees to the horizontal plane of the vehicle and towards the rear of the vehicle on the wheelchair restraint system.

A.5.3.8.2.7 In every case the forces shall be applied to the wheelchair user restraint system by means of a traction device appropriate to the belt type as specified in standard ECE 14.

A.5.3.8.3 Forward-facing wheelchair - hybrid test requirements

A.5.3.8.3.1 A wheelchair space shall be fitted with a wheelchair restraint system suitable for general wheelchair application and shall allow the carriage of a wheelchair and a wheelchair user facing the front of the vehicle;

A.5.3.8.3.2 A wheelchair space shall be fitted with a wheelchair user restraint system which shall comprise of a minimum of two anchorage points and a pelvic restraint (lap belt) designed and constructed of components intended to perform in a similar manner to those of a seat belt conforming to ECE 16;

A.5.3.8.3.3 Any restraint system fitted to a wheelchair space shall be capable of being easily released in the case of an emergency;

A.5.3.8.3.4 Any wheelchair restraint system shall either:

A.5.3.8.3.4.1 Meet the dynamic test requirements described in paragraph A.5.3.8.3.8 and be securely attached to vehicle anchorages meeting the static test requirements in paragraph A.5.3.8.3.6 ; or

A.5.3.8.3.4.2 Be securely attached to vehicle anchorages such that the combination of restraint and anchorages meets the requirements of paragraph A.5.3.8.3.8 .

A.5.3.8.3.5 Any wheelchair user restraint shall either:

A.5.3.8.3.5.1 Meet the dynamic test requirements described in paragraph A.5.3.8.3.9 and be securely attached to vehicle anchorages meeting the static test requirements in paragraph A.5.3.8.3.6 ; or

A.5.3.8.3.5.2 Be securely attached to vehicle anchorages such that the combination of restraint and anchorages meets the dynamic test requirements described in paragraph A.5.3.8.3.9 when attached to anchorages set up as described in paragraph A.5.3.8.3.6.7 .

A.5.3.8.3.6 A static test shall be carried out on the anchorage points for both the wheelchair restraint system and the wheelchair user restraint in accordance with the following requirements:

A.5.3.8.3.6.1 The forces specified in paragraph A.5.3.8.3.7 shall be applied by means of a device reproducing the geometry of the wheelchair restraint system ;

A.5.3.8.3.6.2 The forces specified in paragraph A.5.3.8.3.7.3 shall be applied by means of a device reproducing the geometry of the wheelchair user restraint and by means of a traction device specified in ECE 14.

A.5.3.8.3.6.3 The forces in paragraph A.5.3.8.3.6.1 above and paragraph A.5.3.8.3.6.2 shall be applied simultaneously in the forward direction and at an angle of 10 ± 5 degrees above the horizontal plane;

A.5.3.8.3.6.4 The forces in paragraph A.5.3.8.3.6.1 shall be applied in the rearward direction and at an angle of 10 ± 5 degrees above the horizontal plane;

A.5.3.8.3.6.5 The forces shall be applied as rapidly as possible through the central vertical axis of the wheelchair space; and

A.5.3.8.3.6.6 The force shall be maintained for a period of not less than 0.2 seconds.

A.5.3.8.3.6.7 The test shall be carried out on a representative section of the vehicle structure together with any fitting provided in the vehicle which is likely to contribute to the strength or rigidity of the structure.

A.5.3.8.3.7 The forces specified in paragraph A.5.3.8.3.6 are:

A.5.3.8.3.7.1 In the case of anchorages provided for a wheelchair restraint system fitted to a category M₂ vehicle:

A.5.3.8.3.7.1.1 $1,110 \pm 20$ daN applied in the longitudinal plane of the vehicle and towards the front of the vehicle at a height of not less than 200 mm and not more than 300 mm measured vertically from the floor of the wheelchair space, and

A.5.3.8.3.7.1.2 550 ± 20 daN applied in the longitudinal plane of the vehicle and towards the rear of the vehicle at a height of not less than 200 mm and not more than 300 mm measured vertically from the floor of the wheelchair space;

A.5.3.8.3.7.2 In the case of anchorages provided for a wheelchair restraint system fitted to a category M₃ vehicle

A.5.3.8.3.7.2.1 740 ± 20 daN applied in the longitudinal plane of the vehicle and towards the front of the vehicle at a height of not less than 200 mm and not more than 300 mm measured vertically from the floor of the wheelchair space, and

A.5.3.8.3.7.2.2 370 ± 20 daN applied in the longitudinal plane of the vehicle and towards the rear of the vehicle at a height of not less than 200 mm and not more than 300 mm measured vertically from the floor of the wheelchair space;

A.5.3.8.3.7.3 In the case of anchorages provided for a wheelchair user restraint system the forces shall be in accordance with the requirements of ECE 14. The forces shall be applied by means of a traction device as appropriate to the belt type as specified in ECE 14.

A.5.3.8.3.8 A wheelchair restraint system shall be subject to a dynamic test carried out in accordance with the following requirements:

A.5.3.8.3.8.1 A representative wheelchair test trolley of mass 85 kg shall, from a speed of between 48 km/h to 50 km/h to rest, be subject to a deceleration-time pulse:

- A.5.3.8.3.8.1.1 Exceeding 20 g in the forward direction for a cumulative period of at least 0.015 seconds;
- A.5.3.8.3.8.1.2 Exceeding 15 g in the forward direction for a cumulative period of at least 0.04 seconds;
- A.5.3.8.3.8.1.3 Exceeding a duration of 0.075 seconds;
- A.5.3.8.3.8.1.4 Not exceeding 28 g and for not more than 0.08 seconds;
- A.5.3.8.3.8.1.5 Not exceeding a duration of more than 0.12 seconds, and
- A.5.3.8.3.8.2 A representative wheelchair test trolley of mass 85 kg shall, from a speed of between 48 km/h to 50 km/h to rest, be subject to a deceleration-time pulse:
- A.5.3.8.3.8.2.1 Exceeding 5 g in the rearward direction for a cumulative period of at least 0.015 seconds;
- A.5.3.8.3.8.2.2 Not exceeding 8 g in the rearward direction and for not more than 0.02 seconds;
- A.5.3.8.3.8.3 The test in paragraph A.5.3.8.3.8.2 shall not apply if the same restraints are used for the forward and rearward direction or if an equivalent test has been conducted;
- A.5.3.8.3.8.4 For the above test, the wheelchair restraint system shall be attached to either:
- A.5.3.8.3.8.4.1 Anchorages fixed to the test rig which represents the geometry of the anchorages in a vehicle for which the restraint system is intended, or
- A.5.3.8.3.8.4.2 Anchorages forming part of a representative section of the vehicle for which the restraint system is intended, set up as described in paragraph A.5.3.8.3.6.7 .
- A.5.3.8.3.9 A wheelchair user restraint shall comply with the test requirements specified in ECE 16 or an equivalent test to the deceleration-time pulse in paragraph A.5.3.8.3.8.1 A seat belt approved to ECE 16 and so marked shall be deemed to comply.
- A.5.3.8.3.10 A test in paragraph A.5.3.8.3.6 , A.5.3.8.3.8 or A.5.3.8.3.9 shall be deemed to have failed unless the following requirements are met:
- A.5.3.8.3.10.1 No part of the system shall have failed, or shall have become detached from its anchorage or from the vehicle during the test;
- A.5.3.8.3.10.2 Mechanisms to release the wheelchair and user shall be capable of release after completion of the test;
- A.5.3.8.3.10.3 In the test in paragraph A.5.3.8.3.8 the wheelchair shall not move more than 200 mm in the longitudinal plane of the vehicle during the test;
- A.5.3.8.3.10.4 No part of the system shall be deformed to such an extent after completion of the test that, because of sharp edges or other protrusions, the part is capable of causing injury.
- A.5.3.8.3.11 Its operating instructions shall be clearly displayed adjacent to it.
- A.5.3.8.4 Rearward facing wheelchair - static test requirements
- A.5.3.8.4.1 Vehicles not required to have occupant restraint systems fitted may, as an alternative to the provisions of paragraph A.5.3.8.2 or A.5.3.8.3 be provided with a wheelchair space designed for the wheelchair user to travel unrestrained with the wheelchair facing rearwards against a support or backrest, in accordance with the following provisions:
- A.5.3.8.4.1.1 One of the longitudinal sides of the space for a wheelchair shall rest against a side or wall of the vehicle or a partition;
- A.5.3.8.4.1.2 A support or backrest perpendicular to the longitudinal axis of the vehicle shall be provided in the forward end of the wheelchair space;
- A.5.3.8.4.1.3 The support or backrest shall be designed for the wheels or the back of the wheelchair to rest against the support or backrest in order to avoid the wheelchair from tipping over and shall comply with the provisions of paragraph A.5.3.8.5 ;

A.5.3.8.4.1.4 A handrail or handhold shall be fitted to the side or wall of the vehicle or a partition in such a way to allow the wheelchair user to grasp it easily. This handrail shall not extend over the vertical projection of the wheelchair space, except by not more than 90 mm and only at a height not less than 850 mm above the floor of the wheelchair space;

A.5.3.8.4.1.5 A retractable handrail or any equivalent rigid device shall be fitted on the opposite side of the wheelchair space in order to restrict any lateral shift of the wheelchair and to allow the wheelchair user to grasp it easily;

A.5.3.8.4.1.6 A sign shall be fixed adjacent to the wheelchair area with the following text:

"This space is reserved for a wheelchair. The wheelchair shall be placed facing rearwards resting against the support or backrest with the brakes on".

The provisions of A.1.6.11.8 of Annex 1 apply to any textual markings used.

A.5.3.8.5 Backrest and support requirements

A.5.3.8.5.1 A backrest fitted to a wheelchair space in accordance with paragraph A.5.3.8.4 shall be fitted perpendicular to the longitudinal axis of the vehicle and shall be capable of bearing a load of 250 ± 20 daN applied to the centre of the padded surface of the backrest, at a height of not less than 600 mm and of not more than 800 mm measured vertically from the floor of the wheelchair space, for a minimum of 1.5 seconds by means of a block 200 mm x 200 mm in the horizontal plane of the vehicle towards the front of the vehicle. The backrest shall not deflect more than 100 mm or suffer permanent deformation or damage.

A.5.3.8.5.2 A support fitted to a wheelchair space in accordance with paragraph A.5.3.8.4 shall be fitted perpendicular to the longitudinal axis of the vehicle and shall be capable of withstanding a force of 250 ± 20 daN applied to the centre of the support, for a minimum of 1.5 seconds in the horizontal plane of the vehicle towards the front of the vehicle in the middle of the support. The support shall not deflect more than 100 mm or suffer permanent deformation or damage.

A.5.3.8.6 Example of a backrest meeting the requirements of paragraph A.5.3.8.4.1.3 (see Annex 2, Figure 27).

A.5.3.8.6.1 The bottom edge of a backrest shall be at a height of not less than 350 mm and of not more than 480 mm measured vertically from the floor of the wheelchair space.

A.5.3.8.6.2 The top edge of a backrest shall be at a height of not less than 1,300 mm measured vertically from the floor of the wheelchair space.

A.5.3.8.6.3 A backrest shall have a width of:

A.5.3.8.6.3.1 Not less than 270 mm and of not more than 420 mm up to a height of 830 mm measured vertically from the floor of the wheelchair space, and

A.5.3.8.6.3.2 Not less than 270 mm and of not more than 300 mm at heights exceeding 830 mm measured vertically from the floor of the wheelchair space.

A.5.3.8.6.4 A backrest shall be fitted at an angle of not less than four degrees and of not more than eight degrees to the vertical with the bottom edge of the backrest positioned closer to the rear of the vehicle than the top edge.

A.5.3.8.6.5 The padded surface of a backrest shall form a single and continuous plane.

A.5.3.8.6.6 The padded surface of a backrest shall pass through any point on an imaginary vertical plane situated to the rear of the front end of the wheelchair space and situated not less than 100 mm and not more than 120 mm from the front end of the wheelchair space measured horizontally and not less than 830 mm and not more than 870 mm from the floor of the wheelchair space measured vertically.

A.5.3.9 Door controls

A.5.3.9.1 If a door referred to in paragraph A.5.3.6 is fitted with opening controls for use under normal circumstances, these controls shall:

A.5.3.9.1.1 In the case of exterior controls, be on or adjacent to that door at a height between 850 mm and 1,300 mm from the ground and be not more than 900 mm from the door, and

A.5.3.9.1.2 In the case of interior controls in vehicles of Classes I, II and III, be on or adjacent to that door at a height of between 850 mm and 1,300 mm from the upper surface of the floor nearest the control and be not more than 900 mm in any direction from the door aperture.

A.5.3.10 Provisions for the accommodation of unfolded prams and pushchairs

A.5.3.10.1 (Reserved)

A.5.3.10.2 The dimensions of the unfolded pram or pushchair area shall not be less than 750 mm wide and 1,300 mm long. Its longitudinal plane shall be parallel to the longitudinal plane of the vehicle and the floor surface shall be slip resistant.

A.5.3.10.3 Accessibility to prams and pushchairs areas shall be provided in accordance with the following provisions:

A.5.3.10.3.1 It shall be possible for an unfolded pram or pushchair to be moved freely and easily from the outside of the vehicle through at least one of the service doors into the special area(s)

A.5.3.10.3.1.1 By "*moving freely and easily*", it is meant that:

- (a) There is sufficient space available for the pram or pushchair to be manoeuvred;
- (b) There are no steps, gaps or stanchions which could be an obstacle to the free movement of the pram or pushchair.

A.5.3.10.4 The area shall be fitted with the pictogram shown in Annex 2, Figure 23 C.

A.5.3.10.4.1 The same pictogram shall be placed both on the front nearside of the vehicle and adjacent to the service door that gives access to the pram or pushchair area.

A.5.3.10.5 The following requirements shall apply to the stability of the unfolded pram or pushchair:

A.5.3.10.5.1 One of the longitudinal sides of the space for a pram or pushchair shall rest against a side or wall of the vehicle or a partition;

A.5.3.10.5.2 A support or backrest perpendicular to the longitudinal axis of the vehicle shall be provided in the forward end of the pram or pushchair space;

A.5.3.10.5.3 The support or backrest shall be designed to avoid the pram or pushchair from tipping over and shall comply with the provisions of paragraph A.5.3.8.5 ;

A.5.3.10.5.4 A handrail or handhold shall be fitted to the side or wall of the vehicle or a partition in such a way to allow the accompanying person to grasp it easily. This handrail shall not extend over the vertical projection of the pram or pushchair space, except by not more than 90 mm and only at a height not less than 850 mm above the floor of the pram or pushchair space;

A.5.3.10.5.5 A retractable handrail or any equivalent rigid device shall be fitted on the opposite side of the pram or pushchair space in order to restrict any lateral shift of the pram or pushchair.

A.5.3.10.6 The area shall be provided with a specific control, e.g. a push-button, to enable the passenger with an unfolded pram or pushchair to request that the vehicle be stopped at the next bus stop. The general requirements of paragraph A.1.7.9.1 of Annex 1 shall apply.

A.5.3.10.7 The control shall be fitted with the pictogram described in Figure 23 C of Annex 2. The dimensions of the pictogram may be reduced as needed.

A.5.3.10.8 The area to accommodate the unfolded pram or pushchair may adjoin the area for the wheelchair and be in its extension. Intrusions of stanchions to provide handholds for standing

passengers may be permitted provided the requirement of paragraph A.5.3.10.3 of this annex is met.

A.5.3.10.9 Additional wheelchair areas may be combined with the area for the accommodation of an unfolded pram or pushchair provided the relevant requirements are met. In such a case, the area shall have signs fixed on or adjacent to them with the following text, equivalent text or pictogram: "Please give up this space for a wheelchair user".

A.5.3.11 Provisions for boarding devices

A.5.3.11.1 General requirements:

A.5.3.11.1.1 The controls actuating the boarding devices shall be clearly marked as such. The extended or lowered position of the boarding device shall be indicated by a tell-tale to the driver.

A.5.3.11.1.2 In the event of the failure of a safety device, lifts, ramps and kneeling systems shall be incapable of operation, unless they can be safely operated by manual effort. The type and location of the emergency operating mechanism shall be clearly marked. In the event of power failure, lifts and ramps shall be capable of manual operation.

A.5.3.11.1.3 Access to one of the service or emergency doors on the vehicle may be obstructed by a boarding device providing the following two conditions are satisfied from both inside and outside the vehicle.

A.5.3.11.1.3.1 The boarding device does not obstruct the handle or other device for opening the door.

A.5.3.11.1.3.2 The boarding device can be readily moved to leave the doorway clear for use in an emergency.

A.5.3.11.2 Kneeling system

A.5.3.11.2.1 A switch shall be required to enable operation of the kneeling system.

A.5.3.11.2.2 Any control which initiates the lowering or raising of any part or the whole of the bodywork relative to the road surface shall be clearly identified and be under the direct control of the driver.

A.5.3.11.2.3 The lowering process shall be capable of being stopped and immediately reversed by a control both within the reach of the driver, whilst seated in the cab, and also adjacent to any other operating controls provided for the operation of the kneeling system.

A.5.3.11.2.4 Any kneeling system that is fitted to a vehicle shall not allow the vehicle to be driven at a speed of more than 5 km/h when the vehicle is lower than the normal height of travel.

A.5.3.11.3 Lift

A.5.3.11.3.1 General provisions

A.5.3.11.3.1.1 Lifts shall only be capable of operation when the vehicle is at standstill. Any movement of the platform shall be prevented unless a device preventing the wheelchair from rolling off has been activated or has automatically come into operation.

A.5.3.11.3.1.2 The lift platform shall not be less than 800 mm wide, and not less than 1,200 mm long and shall be capable of operating when carrying a mass of at least 300 kg.

A.5.3.11.3.2 Additional technical requirements for power-operated lifts

A.5.3.11.3.2.1 The operating control shall be designed in such a way that, if released, it automatically returns to the off position. As it does so the movement of the lift shall immediately be stopped and it shall be possible to initiate a movement in either direction.

A.5.3.11.3.2.2 A safety device (e.g. reversing mechanism) shall protect areas not visible to the operator, where the movement of the lift might trap or crush objects.

A.5.3.11.3.2.3 In the event of one of these safety devices coming into operation, the movement of the lift shall immediately be stopped and movement in the opposite direction initiated.

A.5.3.11.3.3 Operation of power operated lifts

A.5.3.11.3.3.1 Where the lift is at a service door situated within the direct field of vision of the driver of the vehicle, the lift may be operated by the driver when in the driver's seat.

A.5.3.11.3.3.2 In all other cases, the controls shall be adjacent to the lift. They shall be capable of being activated and deactivated only by the driver from his seat.

A.5.3.11.3.4 Manually operated lift

A.5.3.11.3.4.1 The lift shall be designed for operation by controls adjacent to the lift.

A.5.3.11.3.4.2 The lift shall be so designed that excessive forces are not required to operate it.

A.5.3.11.4 Ramp

A.5.3.11.4.1 General provisions

A.5.3.11.4.1.1 The ramp shall only be capable of operation when the vehicle is at standstill.

A.5.3.11.4.1.2 Edges on the outside shall be rounded to a radius of no less than 2.5 mm. Corners on the outside shall be rounded to a radius of not less than 5 mm.

A.5.3.11.4.1.3 The useable surface of a ramp shall be at least 800 mm wide. The slope of the ramp, when extended or folded out on to a kerb of 150 mm in height, should not exceed 12 per cent. The slope of the ramp, when extended or folded out to the ground, should not exceed 36 per cent. A kneeling system may be used to achieve this test.

A.5.3.11.4.1.4 Any ramp which when ready for use exceeds 1,200 mm in length shall be fitted with a device to prevent the wheelchair rolling off the sides.

A.5.3.11.4.1.5 Any ramp shall be capable of operating safely with a load of 300 kg.

A.5.3.11.4.1.6 The outer edge of ramp surfaces available for use by a wheelchair shall be clearly marked with a band of colour 45 mm to 55 mm in width which contrasts visually with the remainder of the ramp surface. The band of colour shall extend along the outermost edge and along both edges parallel to the direction of travel of the wheelchair.

Marking of any trip hazard or where part of the ramp surface also forms part of the step is permissible.

A.5.3.11.4.1.7 A portable ramp shall be secure when in its position for use. A portable ramp shall be provided with a suitable position where it can be safely stowed and where it is readily available for use.

A.5.3.11.4.2 Modes of operation

A.5.3.11.4.2.1 Deployment and stowage of the ramp may be either manual or power-operated.

A.5.3.11.4.3 Additional technical requirements for power-operated ramps

A.5.3.11.4.3.1 Deployment and stowage of the ramp shall be indicated by flashing yellow lights and an audible signal.

A.5.3.11.4.3.2 Deployment and stowage of the ramp that may create a risk of injury shall be protected by a safety device(s).

A.5.3.11.4.3.3 These safety devices shall stop the movement of the ramp when the ramp is subject to a mean reactive force not exceeding 150 N. The peak force may be higher than 150 N for a short time provided that it does not exceed 300 N. The reactive force may be measured by any method to the satisfaction of the Type Approval Authority. Guidelines for measuring the reactive forces are given in Annex 6 to this standard.

A.5.3.11.4.3.4 The horizontal movement of a ramp shall be interrupted when a mass of 15 kg is placed upon it.

A.5.3.11.4.4 Operation of power-operated ramps

A.5.3.11.4.4.1 Where the driver has adequate view of the ramp sufficient to monitor its deployment and use, to ensure the safety of passengers, the ramp may be operated by the driver when in the driver's seat. This requirement may be met by a suitable indirect vision device(s).

A.5.3.11.4.4.2 In all others cases, the controls shall be adjacent to the ramp. They shall be capable of being activated and deactivated only by the driver from his seat.

A.5.3.11.4.5 Operation of manually-operated ramp

A.5.3.11.4.5.1 The ramp shall be so designed that excessive forces are not required to operate the ramp.

Annex 6

Masses and dimensions

A.6.1 This annex applies to the masses and dimensions of motor vehicles of categories M₂ and M₃ in so far as they are necessary for the approval of a vehicle in respect of its general construction.

A.6.2 Definitions

For the purposes of this annex:

A.6.2.1 "*Group of axles*" means axles being part of a bogie. A two-axle group is called a tandem and a tri-axle group a tri-axle bogie. By convention, a solo axle is considered as a group of one axle.

A.6.2.2 "*Vehicles dimensions*" means the dimensions of the vehicle based on its construction, as stated by manufacturer.

A.6.2.2.1 "*Vehicle length*" is a dimension which is measured according to GSO ISO 612:2007, term No. 6.1.

In addition to the provisions of that standard, when measuring the vehicle length the following devices shall not be taken into account:

- (a) Wiper and washer devices;
- (b) Front or rear marking-plates;
- (c) Customs sealing devices and their protection;
- (d) Devices for securing the tarpaulin and their protection;
- (e) Lighting equipment;
- (f) Mirrors and other devices for indirect vision;
- (g) Watching aids;
- (h) Air-intake pipes;
- (i) Length stops for demountable bodies;
- (j) Access steps and hand-holds;
- (k) Ram rubbers and similar equipment;
- (l) Lifting platforms, access ramps and similar equipment in running order, not exceeding 300 mm, provided that the loading capacity of the vehicle is not increased;
- (m) Coupling devices for motor vehicles;
- (n) Trolley booms of electrically-propelled vehicles;
- (o) External sun visors.

A.6.2.2.2 "*Vehicle width*" is a dimension which is measured according to GSO ISO 612:2007, term No. 6.2.

In addition to the provisions of that standard, when measuring the vehicle width the following devices shall not be taken into account:

- (a) Customs sealing devices and their protection;
- (b) Devices for securing the tarpaulin and their protection;
- (c) Tyre failure tell-tale devices;
- (d) Protruding flexible parts of a spray-suppression;
- (e) Lighting equipment;
- (f) Access ramps in running order, lifting platforms and similar equipment in running order provided that they do not exceed 10 mm from the side of the vehicle and the corners of the ramps facing forwards or rearwards are rounded to a radius of not less than 5 mm; the edges shall be rounded to a radius of not less than 2.5 mm;
- (g) Mirrors and other devices for indirect vision;
- (h) Tyre-pressure indicators;
- (i) Retractable steps;
- (j) The deflected part of the tyre walls immediately above the point of contact with the ground;

- (k) Watching aids;
- (l) Retractable lateral guidance devices on buses and coaches intended for use on guided bus systems, if not retracted;
- (m) Service-door lighting devices.

A.6.2.2.3 "*Vehicle height*" is a dimension which is measured according to GSO ISO 612:2007, term No. 6.3.

In addition to the provisions of that standard, when measuring the vehicle height the following devices shall not be taken into account:

- (a) Aerials;
- (b) Pantographs or trolley booms in their elevated position.

For vehicles with an axle-lift device, the effect of this device shall be taken into account.

A.6.2.3 "*Technically permissible maximum mass on the axle (m)*" means the mass corresponding to the maximum permissible static vertical load exerted by the axle on the road surface, based on the construction of the vehicle and of the axle and as stated by the vehicle manufacturer.

A.6.2.4 "*Technically permissible maximum mass on a group of axles (μ)*" means the mass corresponding to the maximum permissible static vertical load exerted by the group of axles on the road surface, based on both the construction of the vehicle and of the group of axles and as stated by the vehicle manufacturer.

A.6.2.5 "*Towable mass*" means the total load exerted on the road surface by the axle(s) of the towed vehicle(s).

A.6.2.6 "*Technically permissible maximum towable mass (TM)*" means the maximum towable mass stated by the manufacturer.

A.6.2.7 "*Technically permissible maximum mass on the coupling point of a vehicle*" means the mass corresponding to the maximum permissible static vertical load on the coupling point based on the construction of the vehicle and/or coupling device and as stated by the manufacturer. By definition, this mass does not include the mass of the coupling device of the vehicle.

A.6.2.8 "*Technically permissible maximum laden mass of the combination (MC)*" means the total mass of a combination of vehicle and trailer(s) as stated by the manufacturer.

A.6.2.9 "*Axle-lift device*" means a device permanently fitted to a vehicle for the purpose of reducing or increasing the load on the axle(s), according to the loading conditions of the vehicle:

- (a) Either by raising the wheels clear off the ground/lowering them to the ground;
- (b) Or without raising the wheels off the ground, (e.g. in the case of air suspension systems, or other systems);

In order to reduce the wear on the tyres when the vehicle is not fully laden, and/or make starting (moving off) on slippery ground easier for motor vehicles or vehicle combinations, by increasing the load on the driving axle.

A.6.3 Requirements

A.6.3.1 Measurement of the mass of the vehicle in running order and of its distribution among the axles

The mass of the vehicle in running order and its distribution on the axles are measured on the vehicle(s) submitted in accordance with paragraph 4.4. of this standard placed in a stationary position with their wheels set straight ahead. If the measured masses differ by no more than 3 per cent from the masses stated by the manufacturer for the corresponding technical configurations within the type, or by no more than 5 per cent if the vehicle is of category M₂ not exceeding 3,500 kg, the

masses in running order and their distribution among the axles as stated by the manufacturer are used for the purpose of the requirements below. Otherwise the measured masses shall be used and the technical service may then, if necessary, carry out additional measurements on vehicle(s) other than those submitted in accordance with paragraph 4.4. of this standard.

A.6.3.2 Mass distribution calculations

A.6.3.2.1 Calculation procedure

A.6.3.2.1.1 For the purpose of the mass distribution calculations hereafter laid down, the manufacturer shall provide the technical service in charge of the tests, with the information (in tabular or any other appropriate form) necessary to identify for each technical configuration within the vehicle type the corresponding technically permissible maximum laden mass of the vehicle, the technically permissible maximum masses on the axles and groups of axles, the technically permissible maximum towable mass, and the technically permissible maximum laden mass of the combination.

A.6.3.2.1.2 Suitable calculations shall be carried out in order to make sure that the following requirements are fulfilled for each technical configuration within the type. For this purpose, the calculations may be limited to the worst cases.

A.6.3.2.1.3 In the following requirements, the notations M , m_i , μ_j , TM , and MC respectively designate the following parameters, for which the requirements of paragraph A.5.3.2. above shall be fulfilled:

- M = the technically permissible maximum laden mass of the vehicle;
- m_i = the technically permissible maximum mass on the axle designated "i", where "i" varies from 1 to the total number of axles of the vehicle;
- μ_j = the technically permissible maximum mass on the solo axle or group of axles designated "j", where "j" varies from 1 to the total number of solo axles and groups of axles;
- TM = the technically permissible maximum towable mass, and
- MC = the technically permissible maximum laden mass of the combination.

A.6.3.2.1.4 In the case of a solo axle, designated "i" as an axle and "j" as a group of axles, $m_i = \mu_j$ by definition.

A.6.3.2.1.5 In the case of vehicles fitted with loadable axles, the calculations required by paragraph A.6.3.2.1.2. above shall be carried out with the suspension of the axles loaded in the normal running configuration. In the case of vehicles fitted with retractable axles, the calculations required by paragraph A.6.3.2.1.2. above shall be carried out with the axles lowered.

A.6.3.2.1.6 For groups of axles, the manufacturer shall indicate the laws of distribution among the axles of the total mass applied on to the group (for instance by stating the distribution formulae or producing distribution graphs).

A.6.3.2.2 Loading limitations

A.6.3.2.2.1 The sum of the masses m_i shall not be less than the mass M .

A.6.3.2.2.2 For each group of axles designated "j", the sum of the masses m_i on its axles shall not be less than the mass μ_j . In addition, each of the masses m_i shall not be less than the part of μ_j applying on the axle "i" as determined by the mass distribution laws for that group of axles.

A.6.3.2.2.3 The sum of the masses μ_j shall not be less than the mass M .

A.6.3.2.2.4 MC shall not exceed $M + TM$.

A.6.3.2.3 Loading conditions

A.6.3.2.3.1 The vehicle in running order is loaded with: a mass corresponding to the number P of seated passengers, of mass Q ; a mass corresponding to the number SP of

standing passengers, of mass Q uniformly distributed over the surface available for standing passengers S_1 ; where appropriate, a mass WP uniformly distributed over each wheelchair space; a mass equal to B (kg) uniformly distributed in the baggage compartments; a mass equal to BX (kg) uniformly distributed over the surface area of the roof equipped for the carriage of baggage, where: P is the number of seating places. S_1 is the area for standing passengers. In the case of vehicles of classes III or B, $S_1 = 0$. SP , declared by the manufacturer, shall not exceed the value S_1/SSp , where SSp is the conventional space provided for one standing passenger specified in the table below. WP (kg), is the number of wheelchair spaces multiplied by 250 kg representing the mass of a wheelchair and user. B (kg), declared by the manufacturer, shall have a numeric value not less than $100 \times V$. V is the total volume of baggage compartments in m^3 including exterior racks, ski-boxes and baggage compartments, that are attached to the outside of the vehicle. BX , declared by the manufacturer, shall have a numeric value not less than 75 kg/m^2 . Double deck vehicles shall not be equipped for the carriage of baggage on the roof and therefore BX for double-deck vehicles shall be zero.

A.6.3.2.3.2 When the vehicle in running order is laden as described in paragraph A.6.3.2.3.2.1, the mass corresponding to the load on each axle shall not exceed the mass m_i on each axle, and the mass corresponding to the load on each solo axle or group of axles shall not exceed the mass μ_j on that group of axles. Moreover, the mass corresponding to the load on the driving axle or the sum of masses, corresponding to the loads on the driving axles shall be at least 25 per cent of M .

A.6.3.2.3.2.1 The vehicle in running order is loaded with: a mass corresponding to the number P of seated passengers, of mass Q ; a mass corresponding to the number SP of standing passengers, of mass Q uniformly distributed over the surface available for standing passengers S_1 ; where appropriate, a mass WP uniformly distributed over each wheelchair space; a mass equal to B (kg) uniformly distributed in the baggage compartments; a mass equal to BX (kg) uniformly distributed over the surface area of the roof equipped for the carriage of baggage, where:

P is the number of seating places.

S_1 is the area for standing passengers. In the case of vehicles of Classes III or B, $S_1 = 0$.

SP , declared by the manufacturer, shall not exceed the value S_1/S_{Sp} , where S_{Sp} is the conventional space provided for one standing passenger specified in the table below.

WP (kg), is the number of wheelchair spaces multiplied by 250 kg representing the mass of a wheelchair and user.

B (kg), declared by the manufacturer, shall have a numeric value not less than $100 \times V$. This shall include baggage compartments or racks that may be attached to the outside of the vehicle.

V is the total volume of baggage compartments in m^3 . When approving a vehicle of Class I or A, the volume of baggage compartments accessible only from the outside of the vehicle shall be disregarded.

BX , declared by the manufacturer, shall have a numeric value not less than 75 kg/m^2 .

Double-deck vehicles shall not be equipped for the carriage of baggage on the roof and therefore BX for double-deck vehicles shall be zero.

Q and S_{Sp} have values laid down in the following table:

<i>Vehicle class</i>	<i>Q (kg) mass of one passenger</i>	<i>S_{sp} (m²/passenger) conventional space for one standing passenger</i>
Classes I and A	68	0.125
Class II	71*	0.15
Classes III and B	71*	None

* Including 3 kg for hand baggage.

A.6.3.2.3.2.2 In the case of a vehicle equipped with a variable seating capacity, area available for standing passengers (S₁) and/or equipped for the carriage of wheelchairs, the requirements of paragraphs A.6.3.2.3.1 and A.6.3.2.3.2 shall be determined for each of the following conditions as applicable:

A.6.3.2.3.2.2.1 With all possible seats occupied followed by the remaining area for standing passengers (up to the standing capacity limit declared by the manufacturer, if reached, excluding areas designated for use exclusively by wheelchair users) and, if space remains, any wheelchair spaces occupied;

A.6.3.2.3.2.2.2 With all possible standing areas occupied (up to the standing capacity limit declared by the manufacturer, excluding areas designated for use exclusively by wheelchair users), followed by the remaining seats available for seated passengers and, if space remains, any wheelchair spaces occupied;

A.6.3.2.3.2.2.3 With all possible wheelchair spaces occupied followed by the remaining area for standing passengers (up to the standing capacity limit declared by the manufacturer, if reached) and then the remaining seats available for use occupied.

A.6.3.2.3.3 When the vehicle is in running order or laden as specified in paragraph A.6.3.2.3.2.1, the mass corresponding to the load on the front axle or group of axles shall not be less than the percentage of the mass of the vehicle in running order or of the technically permissible maximum laden mass "M" laid down in the following table:

<i>Classes I and A</i>		<i>Class II</i>		<i>Classes III and B</i>	
<i>Rigid</i>	<i>Articulated</i>	<i>Rigid</i>	<i>Articulated</i>	<i>Rigid</i>	<i>Articulated</i>
20	20	25 ¹	20	25 ¹	20

¹ This figure is reduced to 20 per cent for 3 axle vehicles of Classes II and III having two steered axles.

A.6.3.2.3.4 Where a vehicle is to be approved to more than one class, paragraphs A.6.3.2.3.1. and A.6.3.2.3.2. shall apply to each class.

A.6.3.3 Marking of vehicles

A.6.3.3.1 The vehicle shall be clearly marked on the inside in a position visible to the driver in his seating position:

A.6.3.3.1.1 In letters or pictograms not less than 10 mm high and numbers not less than 12 mm high, with:

A.6.3.3.1.1.1 The maximum number of seating places the vehicle is designed to carry;

A.6.3.3.1.1.2 The maximum number of standing places, if any, the vehicle is designed to carry;

A.6.3.3.1.1.3 The maximum number of wheelchairs which the vehicle is designed to carry, if any.

A.6.3.3.1.2 In letters or pictograms not less than 10 mm high and numbers not less than 12 mm high, with:

A.6.3.3.1.2.1 The mass of baggage which may be carried when the vehicle is fully loaded according to paragraph A.6.3.2.3. of this annex.

A.6.3.3.1.2.2 As appropriate this shall include the mass of baggage:

A.6.3.3.1.2.2.1 In baggage compartments (mass B, paragraph A.6.3.2.3.2.1);

A.6.3.3.1.2.2.2 On the roof if equipped for the carriage of baggage (mass BX, paragraph A.6.3.2.3.2.1).

A.6.3.3.2 Space shall be provided adjacent to the above markings allowing the vehicle to be marked, in letters or pictograms not less than 10 mm high and numbers not less than 12 mm high, with the mass of baggage B and BX which may be carried when the vehicle is loaded with the maximum number of passengers and crew and the vehicle is not exceeding the maximum laden mass, or the maximum mass of any axle or group of axles at which the vehicle can be put into service in the Contracting Party where it is to be registered. Contracting Parties that require the marking of this mass shall, in agreement with the manufacturer, determine the mass of baggage to be marked and take the necessary measures to ensure that vehicles are so marked prior to their registration.

A.6.3.4 Manœuvrability

A.6.3.4.1 Any vehicle shall be able to manoeuvre on either side for a complete circular trajectory of 360° inside an area defined by two concentric circles, the outer circle having a radius of 12.50 m and the inner circle having a radius of 5.30 m, without any of the vehicle's outermost points (with the exception of the protruding parts excluded from the measurement of the vehicle width) projecting outside the circumferences of the circles. For vehicles with axle-lift devices, this requirement also applies with the retractable axle(s) in the lifted position or loadable axle(s) in the unladen condition.

A.6.3.4.1.1 The requirements of paragraph A.6.3.4.1 shall be verified with the outermost front point of the vehicle guided along the contour of the outer circle (see Figure A).

A.6.3.4.2 With the vehicle stationary, a vertical plane tangential to the side of the vehicle and facing outwards from the circle shall be established by marking a line on the ground. In the case of an articulated vehicle, the two rigid portions shall be aligned with the plane. When the vehicle moves from a straight line approach into the circular area described in paragraph A.6.3.4.1, no part of it shall move outside of that vertical plane by more than 0.60 m (see Figures B and C).

Figure A

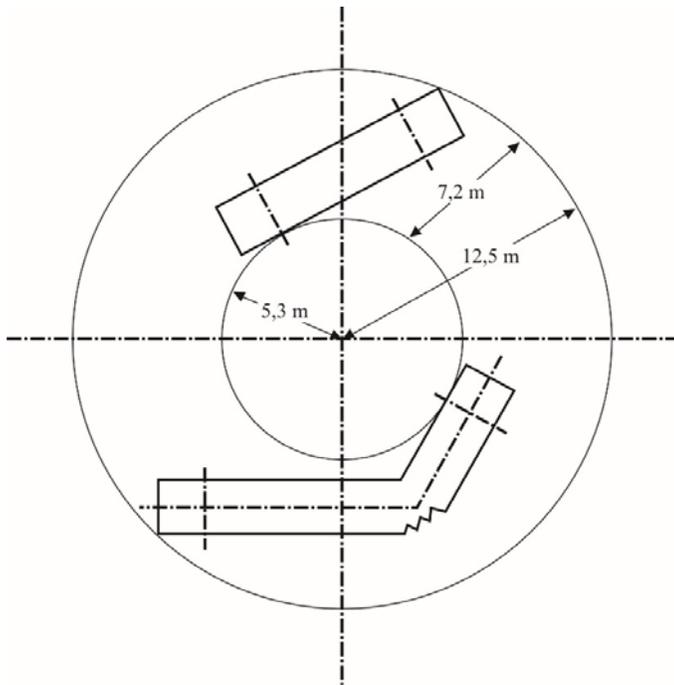

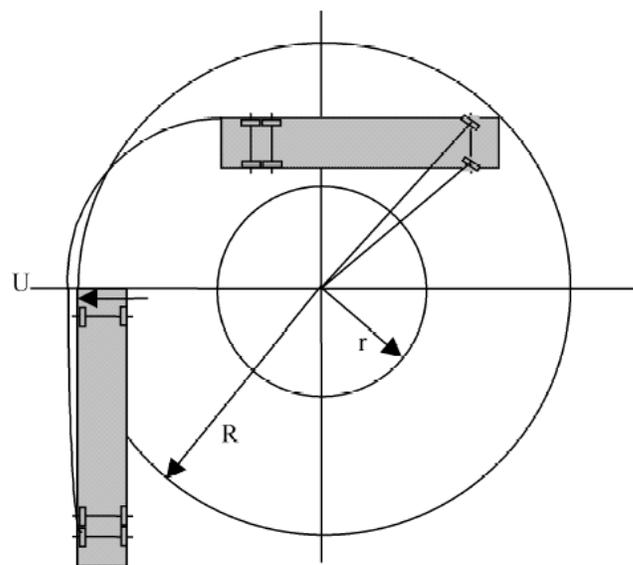

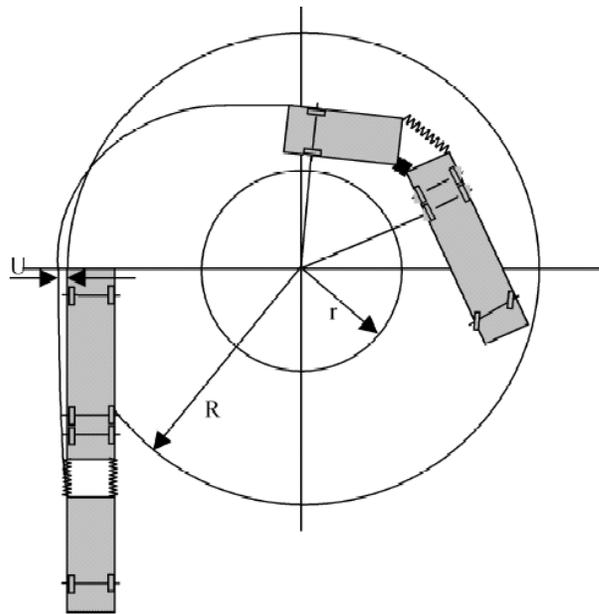

Figure B

- R = 12.5 m
- r = 5.3 m
- U = maximum 0.6 m

Figure C

R	=	12.5 m
r	=	5.3 m
U	=	maximum 0.6 m

A.6.3.4.3 The requirements of paragraphs A.6.3.4.1 to A.6.3.4.2 may also be verified, at the request of the manufacturer, with an appropriate equivalent calculation or geometric demonstration.

A.6.3.4.4 In the case of incomplete vehicles, the manufacturer shall declare the maximum permissible dimensions for which the vehicle is to be checked against the requirements of A.6.3.4.1 and A.6.3.4.2 .

Annex 7**Additional safety prescriptions for trolleybuses****A.7.1 Definitions and operating parameters**

For the purpose of this annex:

A.7.1.1 "Line voltage" means the voltage provided to the trolleybus from the external power supply.

Trolleybuses shall be designed to operate at a rated line voltage of either:

- (a) 600 V (a working range of 400 to 720 V, and 800 V DC for 5 minutes); or
- (b) 750 V (a working range of 500 to 900 V, and 1,000 V DC for 5 minutes); and
- (c) Withstand over-voltages of 1,270 V for 20 ms."

A.7.1.2 The electrical circuits of a trolleybus are classified according to their rated voltage in the following classes:

A.7.1.2.1 "Voltage Class A" means a:

Rated voltage ≤ 30 V AC; and

Rated voltage ≤ 60 V DC."

A.7.1.2.2 "Voltage Class B" means a:

30 V AC $<$ rated voltage $\leq 1,000$ V AC; and

60 V DC $<$ rated voltage $\leq 1,500$ V DC.

A.7.1.2.3 "*Three phase circuits*" means circuits supplied with a three-phase voltage not exceeding 400 V AC.

A.7.1.3.1 Rated climatic conditions

A.7.1.3.1 Trolleybuses shall be designed to operate reliably under the following environmental conditions:

A.7.1.3.1.1 A temperature range of minus 25 °C to plus 40 °C;

A.7.1.3.1.2 A relative humidity of 98 per cent at temperatures up to 25 °C;

A.7.1.3.1.3 An atmospheric pressure range from 86.6 kPa to 106.6 kPa;

A.7.1.3.1.4 An altitude range from sea level to a maximum of 1,400 m above the sea level.

A.7.1.4 "*Self-extinguishing material*" means a material that does not continue to burn when the ignition source is removed.

A.7.1.5 "Insulation": there are different types of insulation:

A.7.1.5.1 Functional insulation: ensures the functionality of the equipment;

A.7.1.5.2 Basic insulation: protects persons from electrical hazards in systems with protective bonding;

A.7.1.5.3 Supplementary insulation: protects persons from electrical hazards in systems

without protective bonding;

A.7.1.5.4 Double insulation: combination of basic and supplementary, each individually testable by a metallized intermediate layer.

A.7.1.6 "Rated insulation voltage"

A.7.1.6.1 For circuits connected to the line voltage, the rated insulation voltage (U_{Nm}) for each part of the double insulation is the maximum line voltage according to paragraph A.7.1.1 ; and

A.7.1.6.2 For circuits insulated from the line voltage, the rated insulation voltage (U_{Nm})

is the maximum permanent voltage that occurs in the circuit.

A.7.2 Current collection

A.7.2.1 Current shall be obtained from the contact wires by means of one or more connecting devices, normally comprising two current collectors. (A single current collector or a pantograph may be used in guided applications.) A current collector shall consist of a roof mounting (trolley base), a trolley pole, a current collector head and a replaceable contact surface insert. Current collectors shall be mounted so that they can turn in both horizontal and vertical directions.

A current collector shall achieve, as a minimum, a $\pm 55^\circ$ rotation about the vertical axis of its attachment to the trolleybus and a $\pm 20^\circ$ rotation about the horizontal axis of its attachment to the trolleybus.

A.7.2.2 Trolley poles shall be made either of a material providing insulation or of metal covered with insulating material representing functional insulation to avoid short circuiting between the overhead lines in case of their detachment (de-wiring) and shall be resistant to mechanical shocks.

A.7.2.3 Current collectors shall be designed to maintain adequate positive contact with the contact wires when the wires are located at least between 4 and 6 metres above the ground and to allow the longitudinal axis of the trolleybus to deviate at least 4.0 metres to either side of the mean axis of the contact wires.

A.7.2.4 Each trolley pole shall be equipped with a device that automatically retracts the pole in the event of the current collector becoming accidentally detached from the contact wire (de-wired).

A.7.2.5 In the event of de-wiring, contact between the retracted poles and any part of the roof shall be prevented.

A.7.2.6 The current collector head, if disconnected from its normal position on the trolley pole, shall remain attached to the trolley pole."

A.7.2.7 The insulation resistance between the electric power collector and the roof mounting/trolley base shall be at least 10 M Ω :

A.7.2.7 Current collectors may be equipped with remote control from the driver's compartment, at least for retraction."

A.7.2.8 Provision shall be made to enable the driver to replace, if necessary, contact surface inserts while the vehicle is in operation on the road.

A.7.3 Traction and auxiliary equipment

A.7.3.1 Electrical components installed on the trolleybus shall be protected against over-voltage and short-circuit current. The protection shall preferably be assured by circuit breakers that are reset automatically, remotely or manually.

A.7.3.2 Electrical components shall be protected against commutation or atmospheric over-voltage.

A.7.3.3 Circuit breakers shall provide interruption of particular damaged circuits.

A.7.3.4 If any circuit includes a single-pole circuit breaker, it shall be installed in the positive wire of the circuit.

A.7.3.5 All electrical circuits and circuit branches of voltage Class B shall be of dual wiring. The trolleybus body may be used as a conductor for protective bonding of circuits, double insulated from the line voltage, of voltage Class B. It also may be used as the return connection for voltage Class A circuits."

A.7.3.6 Battery cases, covers and trays shall be made of non-flammable or self-extinguishing materials.

A.7.3.7 Electrical components connected to the line voltage shall have, in addition to their basic insulation, a supplementary insulation from the trolleybus body, the onboard power supply and signal interfaces.

For protection of current conducting parts and metallized intermediate layers inside the passenger compartment or luggage compartment, the protection degree IPXXD shall be provided (according to GSO ISO 20653:2015).

For protection of current conducting parts and metallized intermediate layers in areas other than the passenger compartment or luggage compartment and not on the roof, the protection degree IPXXB shall be satisfied (according to GSO ISO 20653:2015).

For protection of current conducting parts and metallized intermediate layers on the roof with protection by distance, no protection degree is required."

A.7.3.7.1 External insulations, e.g. on the roof and at the traction motor with occasional conductivity and regular cleaning, shall have a minimum clearance of 10 mm. They shall be mounted with shelter from weather or be designed as umbrella insulators or insulators with drip edge or another method having equivalent effects. Silicon as material or covering is recommended. In this case, the minimum creep age distance shall be 20 mm. With other materials or designs or mountings or extreme operation conditions, a greater creep age distance shall be chosen. Documentation of the layout is part of the approval .

A.7.3.7.2 Voltage class B equipment shall be marked with the lightning symbol. The symbol background shall be yellow, the bordering and the arrow shall be black.

The symbol shall also be visible on enclosures and barriers, which when removed, expose current conducting parts of voltage class B circuits. Accessibility and removability of barriers/enclosures should be considered when evaluating the requirement for the symbol."

A.7.3.8 The current conducting parts of electrical components, with the exception of current collectors, surge arrestors and traction resistors, shall be protected against moisture and dust.

A.7.3.9 Means shall be provided for a periodic resistance test to be conducted on each basic and supplementary insulation of components with double insulation. With a new and dry trolleybus, the insulation resistance of electrical circuits at a test voltage of 1,000 V DC shall not be less than:

A.7.3.9.1 For each basic insulation: 10 M Ω ;

A.7.3.9.2 For each supplementary insulation: 10 M Ω ;

A.7.3.9.3 For the overall double insulation: 10 M Ω .

A.7.3.10 Wiring and apparatus

A.7.3.10.1 Flexible wires shall be used for all circuits. The rated insulation voltage of wires to ground shall be at least the rated insulation voltage according to paragraph 1.6."

A.7.3.10.2 Mounted wiring should not be stressed mechanically.

A.7.3.10.3 Wiring insulation shall not propagate burning.

A.7.3.10.4 Wiring of different voltages classes shall be mounted separately.

A.7.3.10.5 Wiring conduits shall be made of non-flammable or self-extinguishing material. Conduits inside the passenger compartment of voltage Class B shall be closed and be made of metal. Metallic conduits shall be connected to the vehicle chassis."

A.7.3.10.6 [Reserved]

A.7.3.10.7 Wiring located under the floor of the trolleybus shall be contained in conduit that protects it against the ingress and propagation of water and dust.

A.7.3.10.8 Fastening and arrangement of wiring and cables shall be designed to prevent damage by abrasion (chafing) of insulation. Grommets of elastomeric material shall be provided at points where wiring penetrates metal structure. The bend radius of conduits containing wiring shall be at least five times the external diameter of the conduit.

A.7.3.10.9 The location of wiring in the vicinity of circuit breakers shall be designed so as to prevent arcing onto the wiring.

A.7.3.10.10 Precautions shall be taken to avoid damage of wiring from heated resistors and other electrical components. In critical areas thermo-resistant wires shall be used.

A.7.3.10.11 Wiring holders, connectors and other mounting devices shall be made of non-flammable or self-extinguishing materials. Electrical components of the self-extinguishing materials shall only be installed outside the passenger compartment.

A.7.3.10.12 Each of the insulations of voltage Class B equipment onboard the trolleybus shall be tested with an AC power supply at test frequency of 50 - 60 Hz for 1 minute.

The test voltage (U_{Test}) for wiring and components at the trolleybus shall be:

Basic insulation: $U_{Test} = 2 \times UN_m + 1,500 \text{ V}$

Supplementary Insulation: $U_{Test} = 1.6 \times UN_m + 500 \text{ V}$

For circuits double insulated from overhead line voltage, the test voltage (U_{Test}) shall be at least 1,500 V, or:

Basic Insulation: $U_{Test} = 2 \times UN_m + 1,000 \text{ V}$

The equivalent DC test voltage is $\sqrt{2}$ times the AC value.

Circuits directly connected to overhead line shall be double insulated.

A.7.4 Electrical safety of passengers and crew

A.7.4.1 In a trolleybus, each circuit energized by an overhead line voltage shall have double insulation of the vehicle chassis.

A.7.4.2 The influence of dynamic charge currents, caused by capacitive couplings between voltage Class B equipment and electric chassis, shall be reduced by the protective impedance of insulating materials used in entrance areas. Stanchions and handrails at doorways, door panels and handles, mobility aid ramps and the first steps shall be made of insulating material, or covered with mechanical durable insulation or insulated from the trolleybus body.

A.7.4.3 The trolleybus shall be equipped with an onboard device for permanent monitoring of leakage current or voltage between the chassis and the road surface. The device shall automatically disconnect the high voltage circuits from the contact system (when trolleybus is stationary) if the leakage current exceeds 3 mA or if the leakage voltage exceeds 60 V DC (according to GSO IEC 62128-1:2014)."

A.7.4.4 The first steps shall be made of insulating material or covered with mechanically durable insulation. The insulation resistance shall at least be 1.0 M Ω over a contact area of 30,000 \pm 500 mm².

A.7.4.5 Door panels shall be made of insulating material or insulated from the trolleybus body. The insulation resistance shall be at least 1.0 M Ω over a contact area on the panel of 30,000 \pm 500 mm².

A.7.4.6 The external body panels adjacent to the door apertures shall be covered with insulating material. The insulated area shall extend in width at least 500 mm each side of the door apertures and in height at least 2,000 mm from the roadway. The insulation resistance in respect to the trolleybus body shall not be less than 1.0 M Ω over a contact area of 20,000 \pm 500 mm².

A.7.4.7 If the trolleybus is equipped with double-insulated converters, paragraphs 4.3 to 4.6 need not be applied.

A.7.5 The driver's compartment

A.7.5.1 In the driver's compartment, there should not be any high voltage equipment accessible by the driver.

A.7.5.2 As a minimum, the instrument panel shall include:

A.7.5.2.1 Indicator of voltage in the contact system;

A.7.5.2.2 Indicator of zero voltage in the contact system;

A.7.5.2.3 Indicator of state of main automatic line voltage circuit breaker;

A.7.5.2.4 Indicator of charge/discharge of the batteries;

A.7.5.2.5 Indicator of body voltage or leakage current exceeding the limits specified in paragraph A.7.4.2 .

Annex 8 - Part 1**Fire suppression system approved as a component****1. Specifications**

1.1. Fire suppression systems shall be tested for high-load fire, low-load fire, high-load fire with fan and re-ignition.

1.2. The test apparatus, test fires and general test conditions are described in Appendix 1 to this annex.

1.3. High-load fire

1.3.1. The test shall be conducted in accordance with Appendix 2 to this annex.

1.3.2. The test shall be conducted with the extinguishing agent and the propellant gas vessel or the suppression agent generator cooled to the minimum operating temperature for the fire suppression system, as declared by the manufacturer.

1.3.3. The fires shall be fully extinguished, at the latest in the minute after activation or before the extinguishing agent has been fully used, whichever happens first.

1.3.4. The test is considered passed either after success at first attempt or at two of three attempts in a case when first of these attempts fails.

1.4. Low-load fire

1.4.1. The test shall be conducted in accordance with Appendix 3 to this annex.

1.4.2. The fires shall be fully extinguished, at the latest in the minute after activation or before the extinguishing agent has been fully used, whichever happens first.

1.4.3. The test is considered passed if success was achieved at the first attempt or at two of three attempts in a case when first of these attempts fails.

1.5. High-load fire with fan

1.5.1. The test shall be conducted in accordance with Appendix 4 to this annex.

1.5.2. The fires shall be fully extinguished either in the minute after activation or upon end of the discharge of the suppression system.

1.5.3. The test is considered passed if success was achieved at the first attempt or at two of three attempts in a case when first of these attempts fails.

1.6. Re-ignition test

1.6.1. The test shall be conducted in accordance with Appendix 5 to this annex.

1.6.2. Re-ignition shall not occur within 45 seconds of the fire being fully extinguished.

1.6.3. The test is considered passed either if success was achieved at the first attempt or at two of three attempts in a case when first of these attempts fails.

Annex 8 – Part 2**Fire suppression system installed in a specific engine compartment****1. Specifications**

1.1. A specific engine compartment means engine compartments which do not differ in the following essential aspects:

- (a) The position of the engine compartment;
- (b) Maximum gross volume;
- (c) General layout of components in the compartment (i.e. position of the determined fire hazards).

For compartments where a combustion heater is located items (b) and (c) apply.

1.2. The fire suppression systems shall be tested for high-load fire, low-load fire, high-load fire with fan (to be applied if a fan is fitted in the engine compartment and/or combustion heater compartment) and re-ignition."

1.3. The test apparatus, test fires and general test conditions are described in Appendix 1 to this annex.

In order to facilitate the positioning of the fire trays within the engine and combustion heater compartment additional supports may be used and the height of the prescribed test fire may be lowered to a minimum of 40 mm.

The test conditions in Appendices 2 to 5 may be adapted for the specific engine compartment and combustion heater compartment. The adaptation shall be based on the provisions given in **Annex 3, paragraphs 7.5.1.5.4.2. and 7.5.1.5.4.3.**, determining the fire hazards within the compartment and the scaling of the fire suppression system. The adaptation shall provide an equivalent level of safety. The principles for the adaptation shall be verified by the Technical Service responsible for the tests. The principle of adaption shall be documented and added to the test report.

1.4. High-load fire

1.4.1. The test shall be conducted in accordance with Appendix 2 to this annex.

1.4.2. The test shall be conducted with the extinguishing agent and the propellant gas vessel or the suppression agent generator cooled to the minimum operating temperature for the fire suppression system, as declared by the manufacturer.

1.4.3. The fires shall be fully extinguished, either, in the minute after activation or upon end of the discharge of the suppression system.

1.4.4. The test is considered passed either after success at the first attempt or after success at the second and third attempts in case of failure at the first attempt.

1.5. Low-load fire

1.5.1. The test shall be conducted in accordance with Appendix 3 to this annex.

1.5.2. The fires shall be fully extinguished either in the minute after activation or upon end of the discharge of the suppression system.

1.5.3. The test is considered passed either after success at the first attempt or after success at the second and third attempts in case of failure at the first attempt.

1.6. High-load fire with fan (if a fan is fitted in the engine and/or combustion heater compartment)

1.6.1. The test shall be conducted in accordance with Appendix 4 to this annex.

1.6.2. The fires shall be fully extinguished either in the minute after activation or upon end of the discharge of the suppression system.

1.6.3. The test is considered passed either after success at the first attempt or after success at the second and third attempts in case of failure at the first attempt.

1.7. Re-ignition test

1.7.1. The re-ignition test shall be conducted in accordance with Appendix 5 to this annex.

1.7.2. Re-ignition shall not occur within 45 seconds of the fire being fully extinguished

1.7.3. The test is considered passed either after success at the first attempt or after success at the second and third attempts in case of failure at the first attempt.

Annex 8 - Appendix 1

Test apparatus, test fires and general test specifications

1. Test apparatus

1.1. The test apparatus is to be made of steel plate. The thickness of the steel plate shall be in accordance with Table 1. Figure 1 shows the test apparatus from the front side, Figure 2 from the rear side and Figure 3 from above. The front side of the test apparatus simulates the rear side of a real engine compartment.

Figure 1

Coordinate system for the position of objects in test apparatus (view from front side)

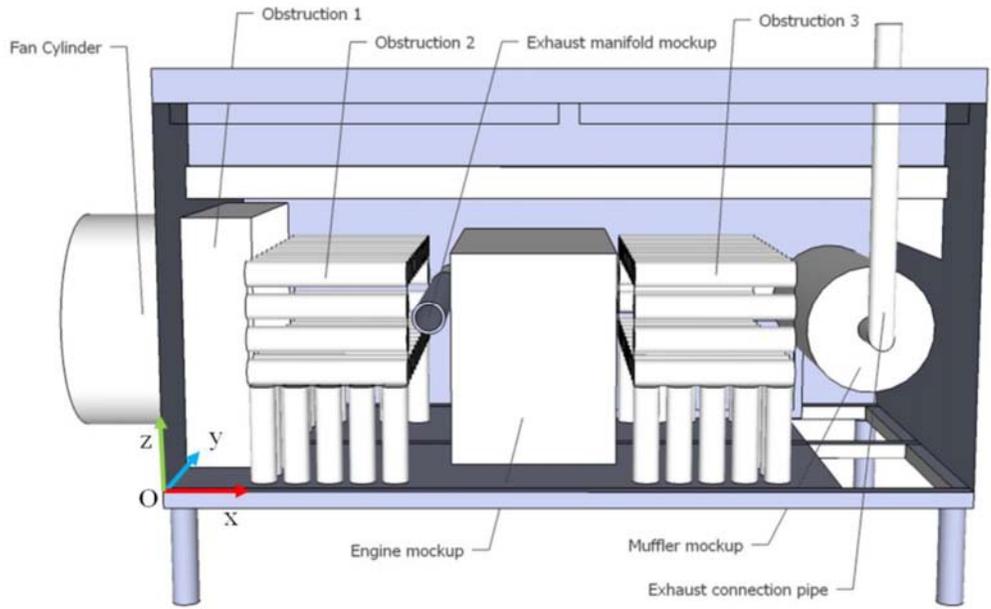

Figure 2

Test apparatus seen from the rear

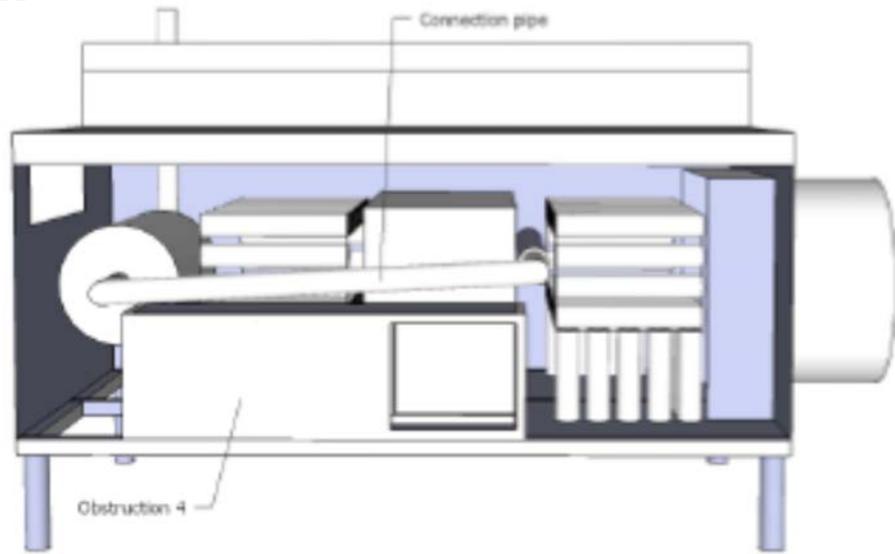

Figure 3
Test apparatus seen from above

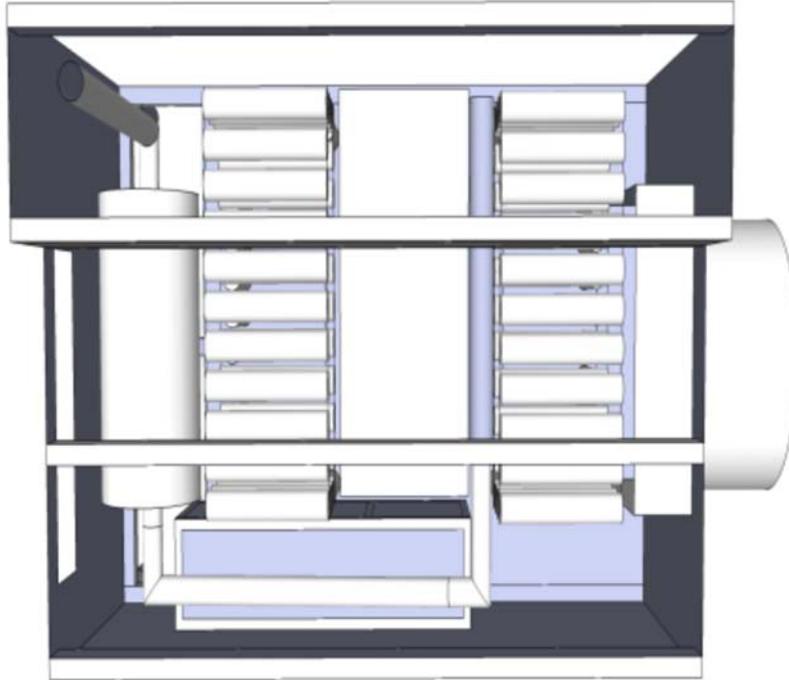

Table 1

Test apparatus objects

<i>Objects</i>	<i>Plate thickness</i>
Fan cylinder	1.5 – 2 mm
Obstructions	1.5 – 2 mm
Exhaust manifold mock-up	8 mm
Engine mock-up	2 – 3 mm
Silencer mock-up	2 – 3 mm
Exhaust pipe	2 – 3 mm
Connection pipe	2 – 3 mm
Walls, ceiling and floor	1.5 – 3 mm

1.2. Object locations

1.2.1. All objects in the test apparatus are positioned according to coordinates (x, y, z) as shown in Table 2. Origin is the position marked (O) in Figure 1. The value of the coordinates is the distance in metres from the origin (see Figure 1), i.e. left-front-bottom corner.

Table 2

Coordinates of objects

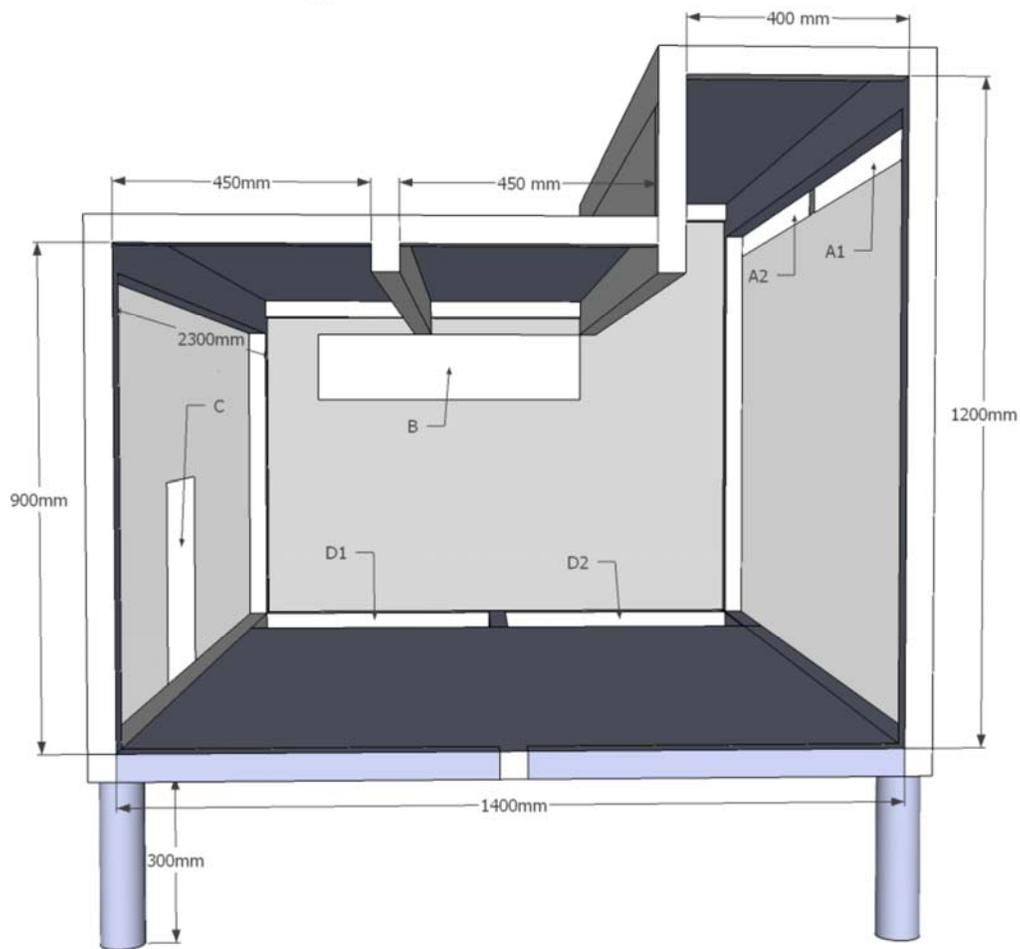

<i>Objects</i>	<i>Coordinates [x; y; z]</i>
Fan cylinder	[-0.60; 0.40; 0.10]
Obstruction 1	[0.0; 0.26; 0.0]
Obstruction 2	[0.26; 0.05; 0.02]
Exhaust manifold mock-up	[0.76; 0.05; 0.47]
Engine mock-up	[0.87; 0.05; 0.04]
Obstruction 3	[1.44; 0.05; 0.02]
Obstruction 4	[0.82; 1.2; 0.0]
Silencer mock-up	[2.0; 0.28; 0.23]

1.3. Framework

1.3.1. The framework of the test apparatus shall be constructed according to Figure 4. The dimensions of the beams are 50 mm × 50 mm and 100 mm × 50 mm respectively. The framework shall be 300 mm above the ground.

Figure 4

Framework for the test apparatus

1.4. Apertures

1.4.1. In addition to the opening for the fan, the test apparatus includes six apertures. The dimensions and positions of the apertures are given according to the coordinates

in Table 3. The positions are given by referring to two diagonally opposite corners (all apertures are rectangular in shape). The apertures are shown in Figure 4.

Table 3

Coordinates of apertures in the test apparatus

<i>Aperture</i>	<i>Coordinates [x; y; z] – [x; y; z]</i>	<i>Area of aperture</i>
A1	[0.03; 0.00; 1.08] – [1.18; 0.00; 1.13]	0.06 m ²
A2	[1.22; 0.00; 1.08] – [2.37; 0.00; 1.13]	0.06 m ²
B	[2.40; 0.50; 0.70] – [2.40; 1.30; 0.90]	0.16 m ²
C	[0.85; 1.50; 0.03] – [1.24; 1.50; 0.36]	0.13 m ²
D1	[2.00; 0.05; 0.00] – [2.35; 0.73; 0.00]	0.27 m ²
D2	[2.00; 0.78; 0.00] – [2.35; 1.20; 0.00]	0.26 m ²
A1	[0.03; 0.00; 1.08] – [1.18; 0.00; 1.13]	0.06 m ²
	Total area of aperture:	0.94 m ²

1.5. Fan

1.5.1. An axial fan with a diameter of 710 mm shall be mounted on the left side of the fan cylinder. The diameter of the cylinder shall be equal to the diameter of the fan. The fan shall produce a certain rate of air flow through the cylinder according to the test scenarios in Appendices 2 to 5. A frequency converter may be used to adjust the fan speed.

1.6. Mock-up components

1.6.1. The dimensions of the engine mock-up are 1,000 mm × 650 mm × 500 mm. The dimensions of the silencer mock-up are diameter 400 mm × 800 mm. The exhaust manifold mock-up shall have the inner dimensions of diameter 80 mm × 900 mm. The mock-up components shall be hollow. The exhaust manifold mock-up shall be connected to the silencer mock-up through a pipe with a diameter of 76 mm. A pipe from the silencer mock-up shall also be used to carry the exhaust gases from the pre-warming system out from the test apparatus.

1.7. Thermocouples

1.7.1. Seven thermocouples (Tc) shall be mounted on the exhaust manifold mock-up, drilled 2 mm into the tube from the outside. Thermocouples Tc1 to Tc4 shall be located on top of the mock-up at the distances from the mock-up inlet according to Table 4. Thermocouples Tc5 to Tc7 shall be located around the mock-up at the same distance from the inlet as Tc2. The location of the thermocouples is illustrated in Figures 5 and 6.

Table 4

Distance to thermocouple from inlet of exhaust manifold mock-up

<i>Thermocouple</i>	<i>Distance from inlet</i>
Tc1	250 mm
Tc2	300 mm
Tc3	350 mm
Tc4	600 mm
Tc5	300 mm
Tc6	300 mm
Tc7	300 mm

Figure 5
Thermocouples on the exhaust manifold mock-up

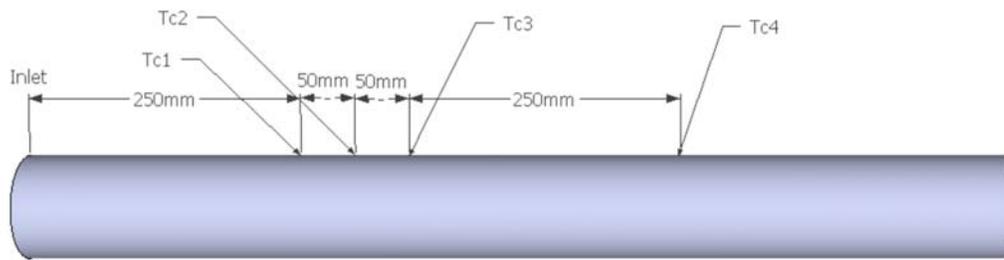

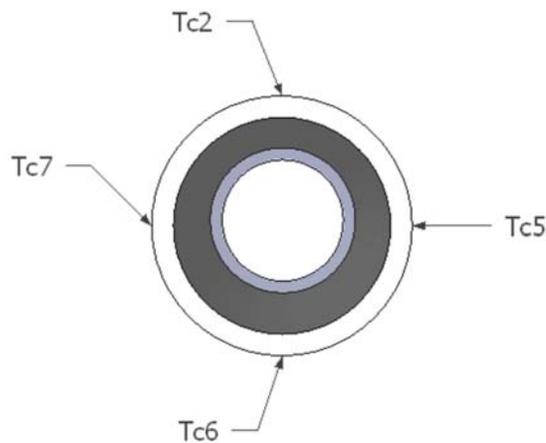

Figure 6
Thermocouples on the exhaust manifold mock-up (the inlet of the mock-up is on the left side)

1.8. Propane burner

1.8.1. The propane burner used to pre-warm the exhaust system shall be chosen as to fulfil the requirements on achieved temperatures specified in paragraph 3.4.6 of this Annex.

1.9. Obstructions

1.9.1. Obstruction 1 has the dimensions of 900 mm × 840 mm × 230 mm, as shown in Figure 7. Obstructions 2 and 3 consist of horizontal and vertical obstruction tubes as shown in Figure 8. The horizontal obstruction tubes are closed and hollow, with a diameter of 80 mm and a length of 480 mm. The vertical tubes are hollow and open in the bottom, with a diameter of 80 mm and a length of 230 mm. The open distance between every tube is 20 mm. Obstruction 4 is a box measuring 1,250 mm × 300 mm × 390 mm as shown in Figure 9.

Figure 7

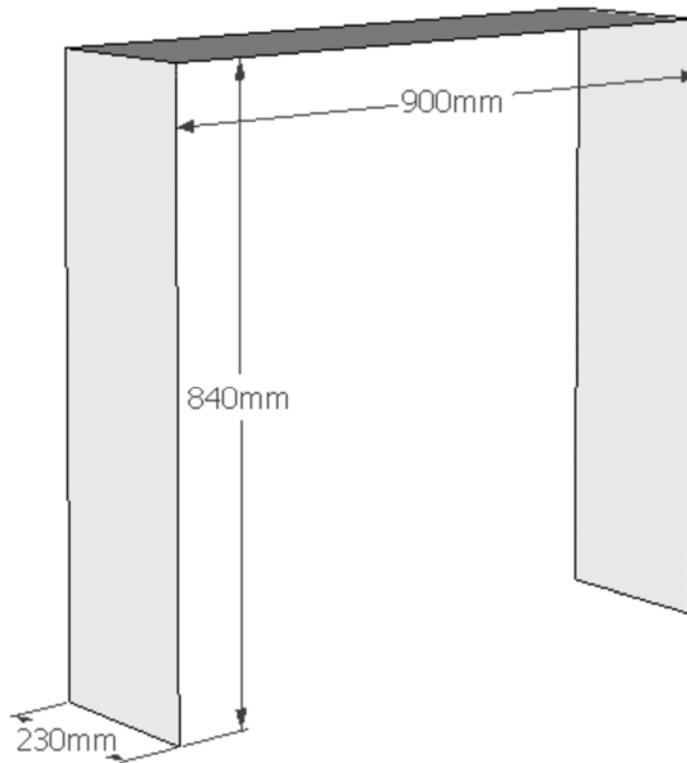

Obstruction 1

Figure 8
Obstruction 2 and 3

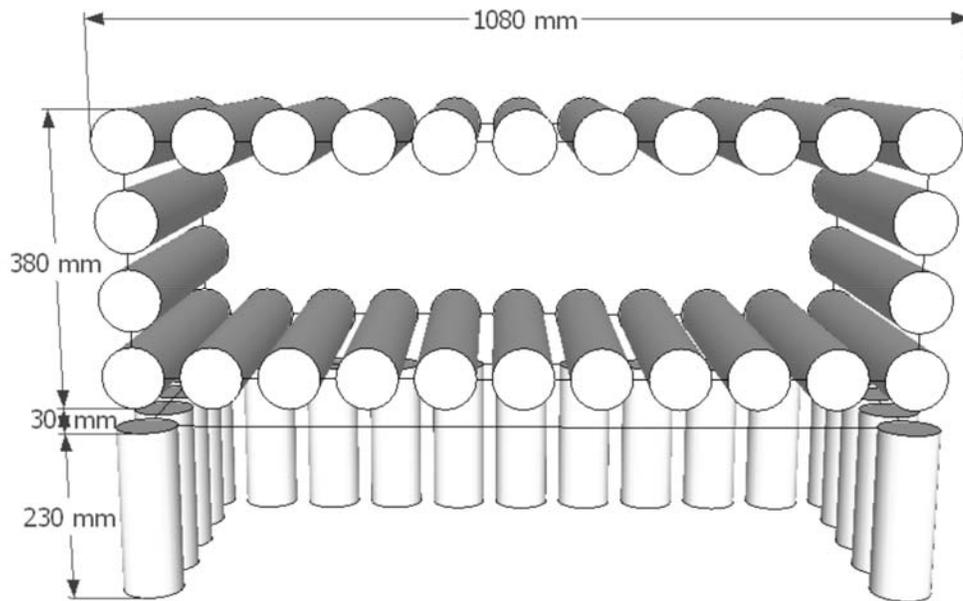

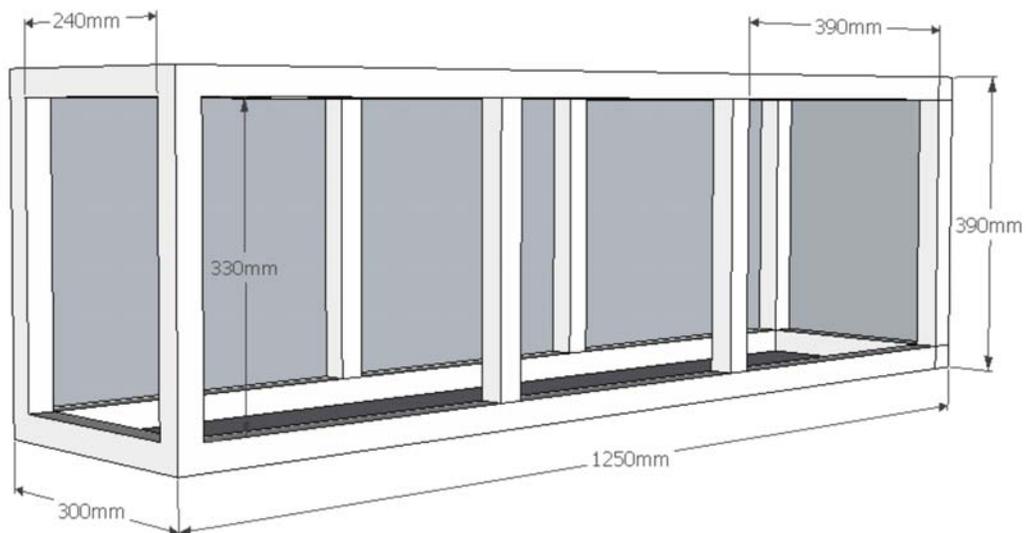

Figure 9
Obstruction 4

1.10. Pool fire trays

1.10.1. Detailed descriptions of these trays are given in Table 5. Three different types of pool fire trays are applied in Table 6: square, rectangular and circular.

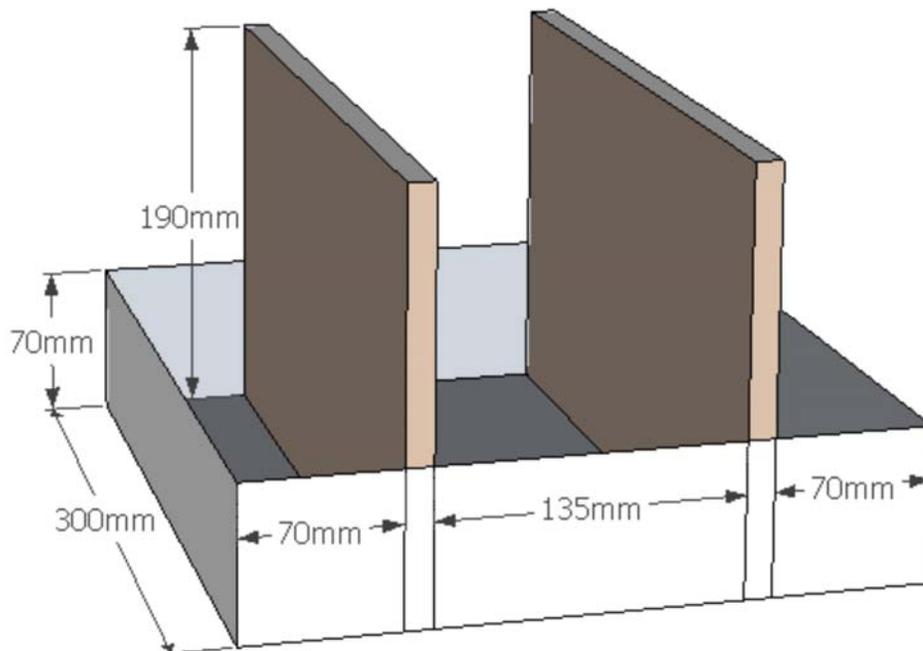

Table 5

Specification of pool fire trays

<i>Dimensions</i>	<i>Rim height</i>	<i>Nominal thickness</i>	<i>Used for test fire No.</i>
300 mm × 300 mm	70 mm	1.5 mm	1, 2
200 mm × 300 mm	70 mm	2 mm	3
Diameter 150 mm	100 mm	1.5 mm	4

1.10.2. The square pool fire trays with fibreboards and the rectangular pool fire trays shall be positioned in its orientation according to the test scenarios in Appendices 2 to 4. Figure 10 shows the dimensions for test fire No. 2. The test fire shall be positioned perpendicular to the long edge of the test apparatus.

Figure 10

Distances for test fire No. 2**2. Test fires**

2.1. The test fires in Table 5 are to be used in the different test scenarios described in Appendices 2 to 5. Diesel oil (commercial fuel oil or light diesel oil), heptane (C₇H₁₆) and engine oil 15W-40 with a flash point COC of 230 °C and viscosity at 40 °C of 107 mm²/s shall be used as test fuels.

Table 6

Test fires

<i>Test fire No.</i>	<i>Description</i>	<i>Fuel</i>	<i>Approximate peak Heat Release Rate 60 sec after ignition</i>
1	Pool fire 300 mm × 300 mm	Diesel oil and heptane	60 kW

2	Pool fire 300 mm × 300 mm and 2 fibreboards	Diesel oil and heptane	110 kW
3	Pool fire 200 mm × 300 mm	Diesel oil and heptane	40 kW
4	Pool fire diameter 150 mm	Diesel oil and heptane	7 kW
5	Spray fire (450 kPa, 0.73 kg/ min ±10%)	Diesel oil	520 kW
6	Spray fire (450 kPa, 0.19 kg/ min ±10%)	Diesel oil	140 kW
7	Dripping oil fire (40 droplets/ min ±10)	Engine oil	5 kW

2.2. The amount of water, diesel and heptane used in the tests shall be in accordance with Table 7.

Table 7
Amount of fuel used in pool fire trays

<i>Dimensions</i>	<i>Water</i>	<i>Diesel</i>	<i>Heptane</i>	<i>Used for test fire No.</i>
300 mm × 300 mm	1.0 l	0.5 l	0.2 l	#1,# 2,
200 mm × 300 mm	0.5 l	0.5 l	0.2 l	#3
Diameter 150 mm	0.2 l	0.2 l	0.1 l	#4

2.3. Test fire No. 2 consists of a heptane pool and two diesel soaked fibreboards with a dry density of 3.5 kg/m³. The dimensions of the fibreboards shall be 12 mm × 295 mm × 190 mm. The fibreboards shall consist of at least 90 per cent raw material from wood. The moisture content in the boards before they are soaked in diesel oil shall not exceed 7 per cent. The fibreboards shall be completely immersed in diesel oil for at least 10 minutes prior to the test and mounted vertically in the pool fire tray not more than 10 minutes before the start of the test.

2.4. Test fire Nos. 5 and 6 consist of diesel oil spray fires while Test fire No. 7 consists of a dripping oil fire (by hot surface ignition).

The spray nozzle for test fire No. 5 shall be a Lechler 460.368.30 or an equivalent.

The spray nozzle for test fire No. 6 shall be a Lechler 212.245.11 or an equivalent.

The spray nozzle for test fire No. 7 shall be a Danfoss 0.60X80H or an equivalent.

3. Installation of the fire suppression system

3.1. To obtain the minimum discharge rate condition, an extinguishing system is to be assembled to its maximum dimensional capability with respect to the number of fittings and size and length of pipe, if relevant. The cylinder is to be used with its rated capacity and the cylinder or gas cartridge pressurized with propellant gas to the normal operating pressure, if relevant.

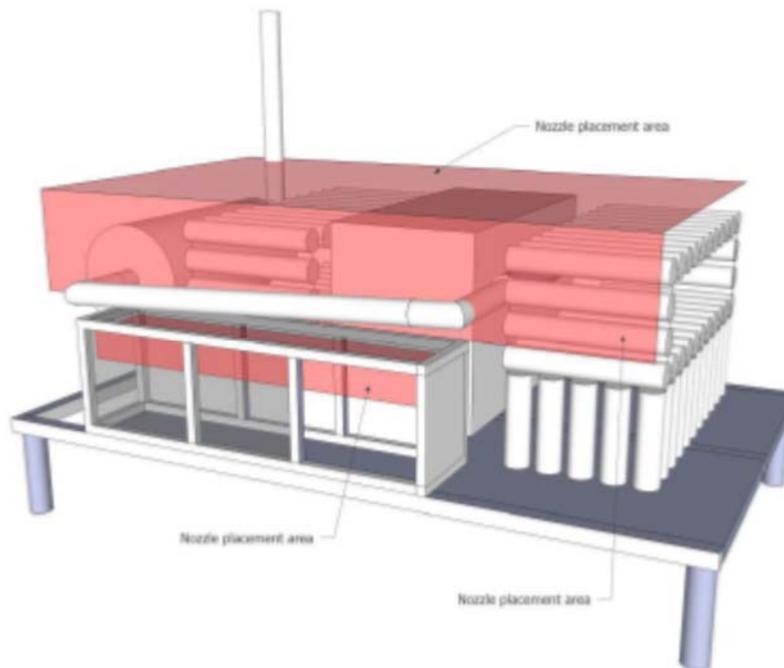

3.2. The fire suppression system shall be installed by the system manufacturer or supplier. Figure 11 shows the area where extinguishing agent discharge points such as of nozzles, extinguishing agent generators or extinguishing agent discharge tubes may be located. The discharge points shall be positioned inside the test apparatus, at two different areas:

(a) In the ceiling and at the rear wall. Discharge points positioned in the ceiling shall be positioned at a minimum of 750 mm above the floor level ($z \geq 0.75$) and outside of Obstruction 1. Nozzles positioned at the rear wall shall be positioned within 350 mm from the rear wall ($y \geq 1.15$) and minimum 450 mm from the floor level ($z \geq 0.45$). Figures 17 and 18 show the area where the nozzles may be located.

(b) Inside the small box (referred to as Obstruction 4) in the rear side of the test apparatus. Nozzles shall be located in the ceiling of the box with a minimum of 290 mm from the floor ($z \geq 0.29$).

Figure 11

Nozzle positioning seen from the rear side of test apparatus

3.3. The system set-up and configuration shall be observed and documented prior to the test (e.g. amount of suppression agent and propellant gas, system pressure, number, type and location of discharge points, length of pipes and number of fittings). Temperature shall be measured during the re-ignition tests at locations specified in Appendix 1.

3.4. Test method

3.4.1. The pool fire trays are to be filled with diesel and heptane on a base of water according to Table 7. Where fibreboards are required to be used as the fire source, they shall be soaked in diesel oil, prior to the test, according to instructions in [paragraph 2.3. above](#).

3.4.2. A pre-burn time based on the information in Appendices 2 to 5 is required. The pre-burn time is measured from the time the first fire is ignited. All pool fires in the test scenarios shall be ignited within the allowed ignition-time, according to Appendices 2 to 5, using a suitable ignition source. The low-load fire tests in Table 1 in Appendix 3 may be performed either individually or concurrently.

3.4.3. A fan is used in some of the test scenarios to obtain a specific air flow rate into the test apparatus. The fan shall be engaged 30 seconds before the suppression system is activated. The fan shall remain active until the test is determined.

3.4.4. A diesel spray is used in some of the test scenarios. The diesel spray shall be activated 10 seconds prior to activation of the suppression system. The diesel spray shall remain active until the result of the test is determined.

3.4.5. After the stipulated pre-burn time, the suppression system shall be manually or automatically activated.

3.4.6. In the test for re-ignition, the exhaust manifold mock-up tube is pre-heated with a burner prior to the test. Pressurized air may be added to the flame for better combustion. ... After 30 seconds the engine oil shall start dripping and the suppression system activated 15 seconds later. The engine oil shall ignite before activation of the suppression system. The oil shall continue to drip on to the tube until the result of the test is determined."

4. Tolerances

4.1. A tolerance of ± 5 per cent of the stipulated values shall apply (for time values: ± 5 seconds).

Annex 8 - Appendix 2 High-load fire

Table 1
Test fires

<i>Test fire No.</i> <i>(see Table 6 in Appendix 1)</i>	<i>Description</i>	<i>Coordinates [x; y; z]</i> <i>(see Figure 1 in Appendix 1)</i>
6	Spray fire (0.45 MPa, 0.19 kg/min)	[1.47; 0.73; 0.46]
3	Pool fire 200 mm × 300 mm	[0.97; 0.85; 0.70]
4	Pool fire diameter 150 mm	[0.97; 1.28; 0.00]
3	Pool fire 200 mm × 300 mm	[1.54; 0.57; 0.36]
2	Pool fire 300 mm × 300 mm and 2 Fibreboards	[1.54; 0.77; 0.36]
3	Pool fire 200 mm × 300 mm	[1.54; 0.13; 0.00]

Note: The fan is not used

Table 2

Test procedure

<i>Time</i>	<i>Action</i>
00:00	Start measuring time
01:20	Ignite pool fires (within 20 seconds)
01:50	Start diesel spray
02:00	Activate suppression system
